Office Clinic Notes

indicate that antibiotic may need to be ineffective. Bactrim DS ordered for patient to take twice daily x5 days. I also ordered Pyridium for patient's complaint of dysuria. Patient encouraged to push fluids, specifically water, and to take antibiotic as directed until completed. Patient advised that if she starts running fever, lower back pain worsens or seems to be one-sided versus another, or if she starts vomiting uncontrollably, then she needs to be seen. Advised patient on side effect profile of antibiotic as well as Pyridium. Patient verbalized understanding about all and has no further questions today.

Ordered:

Bactrim DS 800 mg-160 mg oral tablet, 1 tab, Oral, every 12 hr, # 10 tab, 0 Refill(s), Pharmacy: CVS/pharmacy #6534, 162.56, cm, 03/08/22 14:53:00 EST, Height

Dysuria R30.0

Assessment and Plan

Extracted from:

Title: OV - multiple issues Author: Akande, Olusina Date: 3/24/21

1. Essential hypertension I10
Chronic, controlled.
Complicated by nothing.
Meds: No change in management
Labs: Future labs sent.
Imaging: EKG not on file
Counseled on lifestyle changes such as low salt diet, activity, and excess alcohol.
2. Gastro-esophageal reflux disease without esophagitis K21.9
Chronic, partially controlled.
Meds: Continue H2 therapy
No suspected reflux complications (barret/stricture).
Lifestyle: wt loss, avoid meals 2-3 hrs before bed.
3. Hypothyroidism, acquired, autoimmune E06.3
Chronic, stable
Labs: TSH sent.
Meds: Continue current medication.
Counseled on healthy activity and diet.
4. Mixed hyperlipidemia E78.2
Chronic, stable.
Most likely due to genetic expression.
ASCVD: Pending labs
Meds: No changes in management
Imaging: None.
Discussed healthy lifestyle.
5. History of CVA (cerebrovascular accident) without residual deficits Z86.73
Chronic.
Meds: Continue antiplatelet and statin
Referral: None
Continue to work towards optimal BP and glycemic control.
6. Aneurysm, cerebral I67.1
Subacute, stable.
Patient claims to have had aneurysms seen on imaging.

Logansport FamilyName: **BERRY, VICKIE L**

MRN / FIN: 10502

6187466

Office Clinic Notes

Most recent MRI and MRA reports do not mention anything about aneurysms.

Request for further documentation sent.

7. Keratoconus H18.609

Chronic

Has follow-up with corneal specialist to develop prescription contacts.

Patient to follow-up in 6 months for Medicare wellness.

Assessment and Plan**Extracted from:**

Title: Office Visit Comprehensive

Author: Varhan MD, Kral

Date: 4/13/22

1. Fracture of lateral malleolus of right ankle S82.61XA

2. Displaced fracture of fifth metatarsal bone, right foot, initial encounter for closed fracture S92.351A

Patient missed a step and twisted her right foot and ankle couple days ago. Initially she did not think much of it and she continued to walk but she had persistent right foot and ankle pain. X-rays in the emergency department revealed fracture of her foot and ankle and she was placed in a posterior splint. She had stroke in the past but she did not have any residual motor weakness. She is on Plavix because of her previous stroke. I reviewed her right foot and ankle x-rays. She has a fracture of lateral malleolus distally and comminuted and slightly displaced fracture of the base of her fifth Metatarsal. We discussed the operative and nonoperative options available. The nonoperative option would involve placing her in a walking boot and keeping her nonweightbearing 6 weeks to start with up to 3 months and following her closely with repeated x-rays. Operative option would involve placing a small plate and intramedullary screw in the distal fibula and placing an intramedullary screw into the fifth metatarsal. The rationale for the operative fixation involves stabilization of the fracture and allowing her to weight-bear early. Especially the base of the fifth metatarsal fracture involves an area with decreased blood supply and the pull of the peroneus tendon is in the direction of distraction at the fracture site. The risks of the surgery include but not limited to infection, neurovascular injury, nonunion, malunion, and hardware problems. After discussing the pros and cons of each option she decided to go ahead with surgical treatment. Accordingly we are booking her surgery to be done early next week. She will stop her Plavix this weekend.

Assessment and Plan**Extracted from:**

Title: Office Visit Comprehensive

Author: Ross NP, Jamie L

Date: 5/4/22

1. Aftercare following surgery Z48.89

She is here today for an ORIF of the right lateral malleolus and reduction internal fixation of the right fifth metatarsal. Patient is doing fairly well. She will remain nonweightbearing. She was put in a boot today. Staples were removed atraumatically. Patient will not shower her foot for 24 hours but will not submerge in water for at least 7 days. Patient will follow up in 4 weeks time with x-rays upon arrival.

2. Closed fracture of lateral malleolus of right ankle with routine healing S82.61XD

3. Displaced fracture of fifth metatarsal bone, right foot, subsequent encounter for fracture with routine healing S92.351D

Doctor's Attestation for Scribe: The documentation recorded by the scribe accurately reflects the service I personally performed and the decisions made by me, Jamie Ross

Scribed on:

5/4/2022 10:34:57

Present in room for exam: Yes

Scribe Attestation: Documentation prepared by Kristin Scott, acting as medical Scribe for Jamie Ross.

Assessment and Plan

Extracted from:

Title: Express Med

Author: Emery NP, Rachel E

Date: 6/12/21

1. Loss of perception for smell R48.1, Loss of perception for taste R48.1

Discussed with patient that she likely had COVID-19, but should no longer be contagious since it has been 2+ weeks since her initial symptoms; pt verbalized understanding. Recommended Tylenol for fever, body aches. Discussed symptom control and recommended cool-mist humidifier at bedside, sleeping prone and/or practicing prone positioning several times daily, salt water gargles, warm tea with honey, increased fluid intake, and rest. May take Vitamin C 1000mg daily, Zinc 50-100mg daily, probiotics, Vitamin D 5,000 units daily, and ASA 81mg daily. Pt to go to ER for worsening SOB, SOB at rest, or difficulty breathing; pt voiced understanding once again.

Ordered:

Tessalon Perles 100 mg oral capsule, 100 mg = 1 cap, Oral, TID, PRN as needed for cough, # 30 cap, 0 Refill(s), Start Date: 06/14/21 8:21:00 EDT, Pharmacy: OPTUMRX MAIL SERVICE

Assessment and Plan

Extracted from:

Title: OV: grief, HTN Author: Akande MD, Olusina Date: 11/6/23

1. Prolonged grief disorder F43.81

Chronic, stable.

Assessment: counseled the patient that she does need to start going to a grief share group to deal with some of the feelings that she is having as it is causing other comorbidities, most prominently issues with insomnia.

Meds: No current changes in management.

Labs: N/A

Imaging: N/A

Referral: N/A

Counseling: N/A

Logansport Family

Name: BERRY, VICKIE L

MRN / FIN: 10502

7034804

Office Clinic Notes

2. Vertigo R42

Chronic, stable.

Assessment: The patient has several different comorbidities that could be contributing including history of stroke and symptoms of anxiety and depression relating to her prolonged grief.

Meds: No current changes in management

Labs: N/A

Counseling: counseled the patient on performing the Epley maneuver to decrease the frequency of her symptoms.

3. Essential hypertension I10

Chronic, stable.

Assessment: EKG is on file and labs were reviewed during the appointment.

Meds: The patient will continue to take lisinopril and amlodipine.

Labs: N/A

Imaging: N/A

Referral: N/A

Counseling: Lifestyle changes such as low salt diet, activity, and excess alcohol.

4. Insomnia G47.00

Chronic, stable.

Assessment: A result of the patient's issues with grief that she has not dealt with.

Meds: The patient will continue to take trazodone without any changes in management other than starting to go to a grief share group.

Labs: N/A

Counseling: N/A

5. Keratoconus H18.609

The patient will continue to follow up with her ophthalmologist.

6. Bilateral cataracts H26.9

Depression Screening Tool

Over the last 2 weeks, how often have you been bothered by any of the following problems?

Not at all Several days More than half the day Nearly every day

1. Little interest or pleasure in doing things
2. Feeling down, depressed, or hopeless
3. Trouble falling or staying asleep, or sleeping too much
4. Feeling tired or having little energy
5. Poor appetite or overeating
6. Feeling bad about yourself—or that you are a failure or have let yourself or your family down
7. Trouble concentrating on things, such as reading the newspaper or watching television
8. Moving or speaking so slowly that other people could have noticed. Or the opposite—being so fidgety or restless that you have been moving around a lot more than usual
9. Thoughts that you would be better off dead, or of hurting yourself in some way

If you checked off any problems, how difficult have these problems made it for you to do your work, take care of things at home, or get along with other people?

- Not difficult at all
- Somewhat difficult
- Very difficult
- Extremely difficult

Bone Density

Radiology Report

LEFT TOTAL FEMUR:

T-score current: -0.5

BMD (g/cm²) current: 0.939

RIGHT TOTAL FEMUR:

T-score current: -1.3

BMD (g/cm²) current: 0.843

Right femoral neck WHO FRAX score:

FRAX calculation based on the lowest femoral neck BMD using the WHO fracture risk assessment tool (<http://www.shef.ac.uk/FRAX/tool.jsp>)

Major osteoporotic: 8.3 % (greater than or equal 20% = consider medication)

Hip fracture: 0.9 % (greater than or equal 3% = consider medication)

The National Osteoporosis Foundation (NOF) using FRAX to assist with treatment decision when the following are true:

1. Untreated postmenopausal woman or a man age 50 or older.
2. Low bone mass/osteopenia (T-score between -1 and -2.5).
3. No prior hip or vertebral fracture.
4. An evaluable hip for DXA study (i.e. no bilateral prostheses).

IMPRESSION:

1. Osteopenia (low bone density) based on lowest T-score value of -1.3 at right femoral neck and right total femur.
2. No prior or prior not comparable.
3. Does not meet NOF threshold for medication therapy; however, other clinical factors may supersede this recommendation. National Osteoporosis Foundation (NOF) recommends considering drug therapy for osteopenia (T score -1 to -2.5) in individuals with estimated 10 year hip fracture greater than or equal 3% or major osteoporotic related fracture greater than or equal 20%. Follow up scan in 18-24 months or as clinically indicated.

-------------------------------	---------------------------------------	-----------------------------	-----------------------------------	---------------------------------

Reason for Exam

(CT Angio Brain/Head) Cerebral aneurysm, follow-up

Radiology Report

EXAMINATION: CTA HEAD

Date: 7/20/2022 1:36 PM

History: Female, 69 years old. History of CVA. Evaluation for cerebral aneurysm.

COMPARISON: None.

Technique: Intravenous contrast was administered and imaging of the neck and head was obtained during the arterial phase of the contrast bolus. Two-dimensional and 3-D MIP images for post processing were performed and reviewed. Vessel analysis software was utilized to calculate the minor and major diameter measurements in areas of arterial stenosis. One or more of these dose optimization techniques were utilized: Automated exposure control; mA and/or kV adjustment per patient size (includes targeted exams where dose is matched to clinical indication); or iterative reconstruction. 100 cc of Isovue-370 were administered for this exam.

FINDINGS:

CTA HEAD:

Intracranial arteries:

Internal carotid arteries: Vascular plaque is present involving the cavernous portions of the ICAs. The degree of stenosis is estimated at less than 50% bilaterally.

Anterior cerebral arteries: Widely patent.

Middle cerebral arteries: Widely patent.

Posterior circulation: Widely patent.

Circle of Willis: Normal anatomic variability.

Vertebrobasilar system: Widely patent.

Brain parenchyma: Unremarkable arterial phase, postcontrast appearance.

Extra-axial structures: Unremarkable.

Additional comments: None.

Computed Tomography

Radiology Report

IMPRESSION:

1. No obvious intracranial aneurysm demonstrated on this study. No aneurysms are identified on previous imaging. If the patient has outside imaging demonstrating an aneurysm, we would be happy to review that study and compare to the current exam to discuss a possible very small aneurysm not well demonstrated on this exam.
2. Vascular disease involving the cavernous portions of the ICAs without evidence of a greater than 50% stenosis.

16-CT-22-0004266	5/13/2022 17:00 EDT	CT Head w/o Contrast	Shively FNP-C,Cheryl	69 years

Reason for Exam

(CT Head w/o Contrast) Facial trauma, blunt

Radiology Report

EXAMINATION: CT HEAD W/O CONTRAST

Date: 5/13/2022 4:59 PM

History: Female, 69 years old. Facial trauma, blunt Contrast Documented? -- N/A Tech Notes: -- hit in head/face with scooter / pt states on blood thinners

COMPARISON: Brain MRI performed 9/30/2020

Technique: Noncontrast imaging of the head. One or more of these dose optimization techniques were utilized: Automated exposure control; mA and/or kV adjustment per patient size (includes targeted exams where dose is matched to clinical indication); or iterative reconstruction.

FINDINGS:

Intracranial: No mass effect or midline shift. No CT evidence of acute ischemia or infarction. No abnormal extra-axial collections. No acute intracranial hemorrhage. Negative for hydrocephalus. The basilar cisterns and foramen magnum are preserved.

Atrophy/white matter: Age appropriate cerebral volume and white matter.

Scalp and soft tissues: No acute findings.

Orbits (visible): Unremarkable.

Sinuses and mastoids: A small amount of fluid is seen within the left maxillary sinus. Clear mastoid air cells.

Bones: Unremarkable calvarium and other visualized bony structures.

Additional comments: None.

IMPRESSION: No acute intracranial pathology is identified.

Displaced Medial or Posterior Malleolar Ankle Fracture Treated With ORIF, Care After

This sheet gives you information about how to care for yourself after your procedure. Your health care provider may also give you more specific instructions. If you have problems or questions, contact your health care provider.

What can I expect after the procedure?

After the procedure, it is common to have:

- Pain.
- Swelling.
- A small amount of fluid from your incision.

Follow these instructions at home:

If you have a boot:

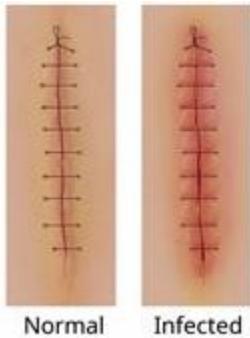

- Wear the boot as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the boot if your toes tingle, become numb, or turn cold and blue.
- Keep the boot clean.
- If the boot is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk of infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

*Discharge Documentation***Bathing**

- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you can take showers.
- If your boot or cast is not waterproof, cover it with a watertight covering when you take a bath or a shower.
- Keep the bandage (dressing) dry until your health care provider says it can be removed.

Incision care

- Follow instructions from your health care provider about how to take care of your incision. Make sure you:
 - Wash your hands with soap and water before you change your dressing. If soap and water are not available, use hand sanitizer.
 - Change your dressing as told by your health care provider.
 - Leave stitches (sutures), skin glue, or adhesive strips in place. These skin closures may need to stay in place for 2 weeks or longer. If adhesive strip edges start to loosen and curl up, you may trim the loose edges. **Do not** remove adhesive strips completely unless your health care provider tells you to do that.
- Check your incision area every day for signs of infection. Check for:
 - Redness.
 - More pain or swelling.
 - Blood or more fluid.
 - Warmth.
 - Pus or a bad smell.

Managing pain, stiffness, and swelling

Discharge Documentation

- If directed, put ice on the affected area.
 - If you have a removable boot, remove it as told by your health care provider.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag or between your cast and the bag.
 - Leave the ice on for 20 minutes, 2-3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) the injured area above the level of your heart while you are sitting or lying down. To do this, try putting a few pillows under your leg and ankle.

Driving

- **Do not** drive or use heavy machinery while taking prescription pain medicine.
- Ask your health care provider when it is safe to drive if you have a boot or cast on your foot.

Activity

- Return to your normal activities as told by your health care provider. Ask your health care provider what activities are safe for you.
- Do exercises as told by your health care provider or physical therapist.
- **Do not** use your injured limb to support (bear) your body weight until your health care provider says that you can. Follow weight-bearing restrictions as told. Use crutches or other devices to help you move around (assistive devices) as directed.

General instructions

- **Do not** put pressure on any part of the cast until it is fully hardened. This may take several hours.
- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider.
- Take over-the-counter and prescription medicines only as told by your health care provider.
- If you are taking prescription pain medicine, take actions to prevent or treat constipation. Your health care provider may recommend that you:
 - Drink enough fluid to keep your urine pale yellow.

Discharge Documentation

- Eat foods that are high in fiber, such as fresh fruits and vegetables, whole grains, and beans.
- Limit foods that are high in fat and processed sugars, such as fried or sweet foods.
- Take an over-the-counter or prescription medicine for constipation.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have a fever.
- Your pain medicine is not helping.
- You have redness around your incision.
- You have more swelling or pain around your incision.
- You have blood or more fluid coming from your incision or leaking through your cast.
- Your incision feels warm to the touch.
- You have pus or a bad smell coming from your incision or dressings.

Get help right away if:

- The edges of your incision come apart after the stitches or staples have been taken out.
- You have chest pain.
- You have difficulty breathing.
- You have numbness or tingling in your foot or leg.
- Your foot becomes cold, pale, or blue.

Summary

- After the procedure, it is common to have some pain and swelling.
- If your boot or cast is not waterproof, **do not** let it get wet.
- Contact your health care provider if you have severe pain or swelling, or if you have more fluids coming from your incision or leaking through your cast.
- Get help right away if you have numbness or tingling in your foot or leg, or if your foot becomes cold, pale, or blue.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

General Anesthesia, Adult, Care After

This sheet gives you information about how to care for yourself after your procedure. Your health care provider may also give you more specific instructions. If you have problems or questions, contact your health care provider.

What can I expect after the procedure?

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6505263

Discharge Documentation

After the procedure, the following side effects are common:

- Pain or discomfort at the IV site.
- Nausea.
- Vomiting.
- Sore throat.
- Trouble concentrating.
- Feeling cold or chills.
- Weak or tired.
- Sleepiness and fatigue.
- Soreness and body aches. These side effects can affect parts of the body that were not involved in surgery.

Follow these instructions at home:

For at least 24 hours after the procedure:

- Have a responsible adult stay with you. It is important to have someone help care for you until you are awake and alert.
- Rest as needed.
- **Do not:**
 - Participate in activities in which you could fall or become injured.
 - Drive.
 - Use heavy machinery.
 - Drink alcohol.
 - Take sleeping pills or medicines that cause drowsiness.
 - Make important decisions or sign legal documents.
 - Take care of children on your own.

Eating and drinking

- Follow any instructions from your health care provider about eating or drinking restrictions.
- When you feel hungry, start by eating small amounts of foods that are soft and easy to digest (bland), such as toast. Gradually return to your regular diet.

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6505263

Discharge Documentation

- Drink enough fluid to keep your urine pale yellow.
- If you vomit, rehydrate by drinking water, juice, or clear broth.

General instructions

- If you have sleep apnea, surgery and certain medicines can increase your risk for breathing problems. Follow instructions from your health care provider about wearing your sleep device:
 - Anytime you are sleeping, including during daytime naps.
 - While taking prescription pain medicines, sleeping medicines, or medicines that make you drowsy.
- Return to your normal activities as told by your health care provider. Ask your health care provider what activities are safe for you.
- Take over-the-counter and prescription medicines only as told by your health care provider.
- If you smoke, **do not** smoke without supervision.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have nausea or vomiting that does not get better with medicine.
- You cannot eat or drink without vomiting.
- You have pain that does not get better with medicine.
- You are unable to pass urine.
- You develop a skin rash.
- You have a fever.
- You have redness around your IV site that gets worse.

Get help right away if:

- You have difficulty breathing.
- You have chest pain.
- You have blood in your urine or stool, or you vomit blood.

Summary

- After the procedure, it is common to have a sore throat or nausea. It is also common to feel tired.
- Have a responsible adult stay with you for the first 24 hours after general anesthesia. It is important to have someone help care for you until you are awake and alert.
- When you feel hungry, start by eating small amounts of foods that are soft and easy to digest (bland), such as toast. Gradually return to your regular diet.
- Drink enough fluid to keep your urine pale yellow.

Echo Report

Name:	BERRY, VICKIE L	Study Date:	08/27/2020
MRN:	10502		
DOB:	03/01/1953	Gender:	Female
Age:	67 yrs	BP:	132/72 mmHg
Height:	64 in	Weight:	175 lb
BSA:	1.8 m ²		
Reason For Study:	HTN, Pre-op		

Procedure:

A two-dimensional transthoracic echocardiogram with color flow and Doppler was performed.

Left Ventricle:

The left ventricle is normal in size. There is normal left ventricular wall thickness. Left ventricular systolic function is normal. The ejection fraction estimate is 60-65%. The left ventricular wall motion is normal. Assessment of diastolic parameters indicates a relaxation abnormality of the left ventricle, consistent with normal filling pressures.

Right Ventricle:

The right ventricle is normal size. The right ventricular systolic function is normal.

Atria:

The left atrial size is normal. Right atrial size is normal.

Mitral Valve:

The mitral valve is normal. There is no mitral valve stenosis. There is no mitral regurgitation noted.

Aortic Valve:

The aortic valve is not well visualized. The aortic valve is mildly calcified. There is no aortic valve stenosis. No aortic regurgitation is present.

Tricuspid Valve:

The tricuspid valve is normal. There is a trace or physiologic amount of tricuspid regurgitation. Right ventricular systolic pressure is normal.

Pulmonic Valve:

There is no pulmonic valvular stenosis. There is no pulmonic valvular regurgitation.

Great Vessels:

* Auth (Verified) *

VICKIE BERRY 8/27/2020

Page 2 of 3

The aortic root is normal size. The inferior vena cava appeared normal and decreased > 50% with respiration.

Pericardium/Pleura:

There is no pericardial effusion.

VICKIE BERRY 8/27/2020

Page 3 of 3

The left ventricle is normal in size.
There is normal left ventricular wall thickness.
Left ventricular systolic function is normal.
The ejection fraction estimate is 60-65%.
Right ventricular systolic pressure is normal.

Chief Complaint
 Right ankle injury.

History Of Present Illness:

69 year old female here to be evaluated with right ankle injury. The accident occurred at home a couple of hours ago. She missed a last step and twisted the right ankle. She has severe pain with weight bearing. And there is swelling. She can move and feel the toes normally. No head injury. No other injury. No other complaints.

Review of Systems:

Constitutional--Negative Except HPI
 Skin--Negative Except HPI
 Musculoskeletal--Negative Except HPI
 Neurologic--Negative Except HPI

Additional ROS Systems Otherwise Negative

Physical Exam

Vitals & Measurements

T: 36.8 °C (Oral) **HR:** 98(Peripheral) **RR:** 16 **BP:** 108/83 **SpO2:** 97%
HT: 162.560 cm **WT:** 77.11 kg **BMI:** 29 **Pain Score:** 8 **O2 Therapy:** Room air

General: Alert and oriented. No acute distress when remaining still.
 HEENT: No obvious deformity noted. Conjunctivae and lids clear. No congestion noted.
 Neck: Supple.
 Heart: Rate is 98 bpm.
 Lungs: No respiratory distress noted.
 Skin: Warm and dry and intact. No rashes or unusual lesions.
 Neurological: Alert. Oriented to person, place, and time. Normal speech.

Emergency Documentation

Right Ankle: Bony tenderness laterally with edema and limited ROM due to pain.
Right Foot: Bony tenderness of the 5th metatarsal with edema laterally.

Medical Decision Making:

Sugar tong and posterior short leg splint applied. Dispensed crutches.

She felt much better.

Based on my best medical judgment (with no immediate intervention needed), made decision no further evaluation or treatment indicated at this time.

Patient (and husband) understands and agrees to the discharge instructions.

Assessment/Plan

Ankle fracture, right S82.891A

Foot fracture, right S92.901A

Orders:

!-Norco 5 mg-325 mg oral tablet, 2 tab, Oral, every 6 hr, PRN as needed for pain, X 3 days, # 24 tab, 0 Refill(s), Start Date: 04/11/22 18:06:00 EDT, Stop Date: 04/14/22 18:06:00 EDT, Pharmacy: CVS/pharmacy #6534

Follow Up

With	When	Contact Information
Kral Varhan	In 2 days 04/13/2022 EDT	

Additional Instructions: Discharge instructions from Dr. Kim:
--Unfortunately, you broke a bone in your right ankle and in your right foot.
--Keep the splint intact and no weightbearing until cleared by doctor taking care of you.
--Elevate above waist level for 3 days is much as possible.
--Apply ice for 20 minutes every 2-3 hours today and tomorrow and the day after.
--Ibuprofen 800 mg every 8 hours today and tomorrow to decrease swelling. Then as needed.
--Norco for pain.
--See an orthopedic surgeon on April 13 for further care.
Dr. Varhan and his associates are good choices.
--Seek immediate medical care with intolerable pain, not being able to move your toes, your toes turning cold and blue, or with any concerns.

Medication Reconciliation

New Prescription

hydrocodone-acetaminophen (!-Norco 5 mg-325 mg oral tablet)2 tab Oral (given by mouth) every 6 hours as needed as needed for pain for 3 Days. Refills: 0.

ibuprofen (ibuprofen 800 mg oral tablet)1 tab Oral (given by mouth) every 8 hours as needed pain, breakthrough for 10 Days. Refills: 0.

Metatarsal Fracture

A metatarsal fracture is a break in one of the five bones that connect the toes to the rest of the foot. This may also be called a forefoot fracture. A metatarsal fracture may be:

- A crack in the surface of the bone (stress fracture). This often occurs in athletes.
- A break all the way through the bone (complete fracture).

The bone that connects to the little toe (fifth metatarsal) is most commonly fractured. Ballet dancers often fracture this bone.

What are the causes?

A metatarsal fracture may be caused by:

- Sudden twisting of the foot.

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- Falling onto the foot.
- Something heavy falling onto the foot.
- Overuse or repetitive exercise.

What increases the risk?

This condition is more likely to develop in people who:

- Play contact sports.
- Do ballet.
- Have a condition that causes the bones to become thin and brittle (osteoporosis).
- Have a low calcium level.

What are the signs or symptoms?

Symptoms of this condition include:

- Pain that gets worse when walking or standing.
- Pain when pressing on the foot or moving the toes.
- Swelling.
- Bruising on the top or bottom of the foot.

How is this diagnosed?

This condition may be diagnosed based on:

- Your symptoms.
- Any recent foot injuries you have had.
- A physical exam.
- An X-ray of your foot. If you have a stress fracture, it may not show up on an X-ray, and you may need other imaging tests, such as:
 - A bone scan.
 - CT scan.
 - MRI.

How is this treated?

Treatment depends on how severe your fracture is and how the pieces of the broken bone line up with each other (alignment). Treatment may involve:

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- Wearing a cast, splint, or supportive boot on your foot.
- Using crutches, and **not** putting any weight on your foot.
- Having surgery to align broken bones (open reduction and internal fixation, ORIF).
- Physical therapy.
- Follow-up visits and X-rays to make sure you are healing.

Follow these instructions at home:

If you have a splint or a supportive boot:

- Wear the splint or boot as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the splint or boot if your toes tingle, become numb, or turn cold and blue.
- Keep the splint or boot clean.
- If your splint or boot is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk for infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

Activity

- **Do not** use your affected leg to support your body weight until your health care provider says that you can. Use crutches as directed.
- Ask your health care provider what activities are safe for you during recovery, and ask what activities you need to avoid.
- Do physical therapy exercises as directed.

Emergency Documentation

Driving

- **Do not** drive or use heavy machinery while taking pain medicine.
- **Do not** drive while wearing a cast, splint, or boot on a foot that you use for driving.

Managing pain, stiffness, and swelling

- If directed, put ice on painful areas:
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag.
 - If you have a removable splint or boot, remove it as told by your health care provider.
 - If you have a cast, place a towel between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) your lower leg above the level of your heart while you are sitting or lying down.

General instructions

- **Do not** put pressure on any part of the cast or splint until it is fully hardened. This may take several hours.
- Take over-the-counter and prescription medicines only as told by your health care provider.
- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider.
- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you may take showers.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if you have:

- Pain that gets worse or does not get better with medicine.

Emergency Documentation

- A fever.
- A bad smell coming from your cast or splint.

Get help right away if you have:

- Any of the following in your toes or your foot, even after loosening your splint (if applicable):
 - Numbness.
 - Tingling.
 - Coldness.
 - Blue skin.
- Redness or swelling that gets worse.
- Pain that suddenly becomes severe.

Summary

- A metatarsal fracture is a break in one of the five bones that connect the toes to the rest of the foot.
- Treatment depends on how severe your fracture is and how the pieces of the broken bone line up with each other (alignment). This may include wearing a cast, splint, or supportive boot, or using crutches. Sometimes surgery is needed to align the bones.
- Ice and elevate your foot to help lessen the pain and swelling.
- Make sure you know what symptoms should cause you to get help right away.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Document Revised: 04/09/2020 Document Reviewed: 01/14/2019
Elsevier Patient Education © 2021 Elsevier Inc.

Ankle Fracture

Emergency Documentation

The ankle joint is made up of the lower (distal) sections of your lower leg bones (tibia and fibula) along with a bone in your foot (talus). An ankle fracture is a break in one, two, or all three of these sections of bone. There are two general types of ankle fractures:

- Stable fracture. This happens when one of your bones is broken, but the bones of your ankle joint stay in their normal positions.
- Unstable fracture. This type can include more than one broken bone. It can also happen if your outer bone is broken and the tough bands of tissue that connect bones (ligaments) are also injured at your inner ankle. This type of fracture allows the talus to move out of its normal position.

What are the causes?

This condition may be caused by:

- A hard, direct hit (blow) to the ankle.
- Quickly and severely twisting your ankle, often while your foot is planted and the rest of your body moving.
- Trauma, such as a car accident or falling from a height.

What increases the risk?

This condition is more likely to occur in people who:

- Smoke.
- Are overweight.
- Participate in sports that involve quick direction changes, as in soccer.
- Do high-impact sports like gymnastics or football.
- Are involved in a high-impact car accident.

Emergency Documentation

What are the signs or symptoms?

Symptoms of this condition include:

- Tender and swollen ankle.
- Bruising around the injured ankle.
- Pain when moving or pressing on the ankle.
- Trouble walking or using the ankle to support your body weight (putting weight on the ankle).
- Pain that gets worse when moving or standing and gets better with rest.

How is this diagnosed?

An ankle fracture is usually diagnosed with a physical exam and X-rays. A CT scan or MRI may also be done.

How is this treated?

Treatment for this condition depends on the type of ankle fracture you have. Stable fractures are treated with a cast, boot, or splint to hold the ankle still and crutches to avoid putting weight on the injured ankle until the fracture heals. Unstable fractures require surgery to ensure that the bones heal properly. After surgery, you will have a splint. After your incision is healed, your surgeon may give you a cast or a boot. You will not be able to put weight on your injured side for several weeks.

After your ankle has healed, you will do exercises to improve the strength and mobility of your ankle.

Follow these instructions at home:

If you have a splint:

- Wear the splint as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the splint if your toes tingle, become numb, or turn cold and blue.
- Keep the splint clean.
- If the splint is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

Emergency Documentation

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk of infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

Managing pain, stiffness, and swelling

- If directed, put ice on the injured area:
 - If you have a removable splint, remove it as told by your health care provider.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag or between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) the injured area above the level of your heart while you are sitting or lying down.

General instructions

- **Do not** use the injured limb to support your body weight until your health care provider says that you can. Use crutches as told by your health care provider
- Take over-the-counter and prescription medicines only as told by your health care provider.
- Ask your health care provider when it is safe to drive if you have a cast or splint.
- Do exercises as told by your health care provider.

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have pain or swelling that gets worse or does not get better with rest or medicine.

Get help right away if:

- Your cast gets damaged.
- You have severe pain that lasts.
- You develop new pain or swelling.
- Your skin or toenails below the injury turn blue or gray, feel cold, become numb, or have a loss of sensitivity to touch.

Summary

- An ankle fracture can either be stable or unstable. This is determined after a physical exam and imaging studies like X-rays, a CT scan, or MRI.
- Stable fractures are treated with a cast, boot, or splint to hold the ankle still until the fracture heals. Unstable fractures require surgery to ensure that the bones heal properly.
- You will not be able to put weight on your injured side for several weeks.
- Pain medicines, icing, and raising (elevating) your injured ankle when sitting or lying down may help with pain relief. Follow instructions as told by your health care provider.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Orthopedics

Acute Knee Pain, Adult

Many things can cause knee pain. Sometimes, knee pain is sudden (acute). It may be caused by damage, swelling, or irritation of the muscles and tissues that support your knee.

Pain may come from:

- A fall.
- An injury to the knee from twisting motions.
- A hit to the knee.
- Infection.

The pain often goes away on its own with time and rest. If the pain does not go away, tests may be done to find out what is causing the pain. These may include:

- Imaging tests, such as an X-ray, MRI, CT scan, or ultrasound.
- Joint aspiration. In this test, fluid is removed from the knee and checked.
- Arthroscopy. In this test, a lighted tube is put in the knee and an image is shown on a screen.
- A biopsy. In this test, a health care provider will remove a small piece of tissue for testing.

Follow these instructions at home:

If you have a knee sleeve or brace that can be taken off:

Emergency Documentation

- Wear the knee sleeve or brace as told by your provider. Take it off only if your provider says that you can.
- Check the skin around it every day. Tell your provider if you see problems.
- Loosen the knee sleeve or brace if your toes tingle, are numb, or turn cold and blue.
- Keep the knee sleeve or brace clean and dry.

Bathing

- If the knee sleeve or brace is not waterproof:
 - **Do not** let it get wet.
 - Cover it when you take a bath or shower. Use a cover that does not let any water in.

Managing pain, stiffness, and swelling

- If told, put ice on the area.
 - If you have a knee sleeve or brace that you can take off, remove it as told.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- If your skin turns bright red, take off the ice right away to prevent skin damage. The risk of damage is higher if you cannot feel pain, heat, or cold.
- Move your toes often to reduce stiffness and swelling.

Emergency Documentation

- Raise the injured area above the level of your heart while you are sitting or lying down. Use a pillow to support your foot as needed.
- If told, use an elastic bandage to put pressure (compression) on your injured knee. This may control swelling, give support, and help with discomfort.
- Sleep with a pillow under your knee.

Activity

- Rest your knee.
- **Do not** do things that cause pain or make pain worse.
- **Do not** stand or walk on your injured knee until you're told it's okay. Use crutches as told.
- Avoid activities where both feet leave the ground at the same time and put stress on the joints. Avoid running, jumping rope, and doing jumping jacks.
- Work with a physical therapist to make a safe exercise program if told. Physical therapy helps your knee move better and get stronger. Exercise as told.

General instructions

- Take your medicines only as told by your provider.
- If you are overweight, work with your provider and an expert in healthy eating, called a dietician, to set goals to lose weight. Being overweight can make your knee hurt more.
- **Do not** smoke, vape, or use products with nicotine or tobacco in them. If you need help quitting, talk with your provider.
- Return to normal activities when you are told. Ask what things are safe for you to do.
- Watch for any changes in your symptoms.
- Keep all follow-up visits. Your provider will check your healing and adjust treatments if needed.

Contact a health care provider if:

- The knee pain does not stop.
- The knee pain changes or gets worse.
- You have a fever along with knee pain.
- Your knee is red or feels warm when you touch it.
- Your knee gives out or locks up.

Get help right away if:

Memorial Hospital

Emergency Documentation

Discharge instructions from Dr. Kim:

- Unfortunately, you broke a bone in your right ankle and in your right foot.
 - Keep the splint intact and no weightbearing until cleared by doctor taking care of you.
 - Elevate above waist level for 3 days is much as possible.
 - Apply ice for 20 minutes every 2-3 hours today and tomorrow and the day after.
 - Ibuprofen 800 mg every 8 hours today and tomorrow to decrease swelling. Then as needed.
 - Norco for pain.
 - See an orthopedic surgeon on April 13 for further care.
- Dr. Varhan and his associates are good choices.
- Seek immediate medical care with intolerable pain, not being able to move your toes, your toes turning cold and blue, or with any concerns.

Patient Education Materials:

Metatarsal Fracture; Ankle Fracture

Metatarsal Fracture

A metatarsal fracture is a break in one of the five bones that connect the toes to the rest of the foot. This may also be called a forefoot fracture. A metatarsal fracture may be:

- A crack in the surface of the bone (stress fracture). This often occurs in athletes.
- A break all the way through the bone (complete fracture).

The bone that connects to the little toe (fifth metatarsal) is most commonly fractured. Ballet dancers often fracture this bone.

What are the causes?

A metatarsal fracture may be caused by:

- Sudden twisting of the foot.

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- Falling onto the foot.
- Something heavy falling onto the foot.
- Overuse or repetitive exercise.

What increases the risk?

This condition is more likely to develop in people who:

- Play contact sports.
- Do ballet.
- Have a condition that causes the bones to become thin and brittle (osteoporosis).
- Have a low calcium level.

What are the signs or symptoms?

Symptoms of this condition include:

- Pain that gets worse when walking or standing.
- Pain when pressing on the foot or moving the toes.
- Swelling.
- Bruising on the top or bottom of the foot.

How is this diagnosed?

This condition may be diagnosed based on:

- Your symptoms.
- Any recent foot injuries you have had.
- A physical exam.
- An X-ray of your foot. If you have a stress fracture, it may not show up on an X-ray, and you may need other imaging tests, such as:
 - A bone scan.
 - CT scan.
 - MRI.

How is this treated?

Treatment depends on how severe your fracture is and how the pieces of the broken bone line up with each other (alignment). Treatment may involve:

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- Wearing a cast, splint, or supportive boot on your foot.
- Using crutches, and **not** putting any weight on your foot.
- Having surgery to align broken bones (open reduction and internal fixation, ORIF).
- Physical therapy.
- Follow-up visits and X-rays to make sure you are healing.

Follow these instructions at home:

If you have a splint or a supportive boot:

- Wear the splint or boot as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the splint or boot if your toes tingle, become numb, or turn cold and blue.
- Keep the splint or boot clean.
- If your splint or boot is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk for infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

Activity

- **Do not** use your affected leg to support your body weight until your health care provider says that you can. Use crutches as directed.
- Ask your health care provider what activities are safe for you during recovery, and ask what activities you need to avoid.
- Do physical therapy exercises as directed.

Emergency Documentation

Driving

- **Do not** drive or use heavy machinery while taking pain medicine.
- **Do not** drive while wearing a cast, splint, or boot on a foot that you use for driving.

Managing pain, stiffness, and swelling

- If directed, put ice on painful areas:
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag.
 - If you have a removable splint or boot, remove it as told by your health care provider.
 - If you have a cast, place a towel between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) your lower leg above the level of your heart while you are sitting or lying down.

General instructions

- **Do not** put pressure on any part of the cast or splint until it is fully hardened. This may take several hours.
- Take over-the-counter and prescription medicines only as told by your health care provider.
- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider.
- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you may take showers.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if you have:

- Pain that gets worse or does not get better with medicine.

Emergency Documentation

- A fever.
- A bad smell coming from your cast or splint.

Get help right away if you have:

- Any of the following in your toes or your foot, even after loosening your splint (if applicable):
 - Numbness.
 - Tingling.
 - Coldness.
 - Blue skin.
- Redness or swelling that gets worse.
- Pain that suddenly becomes severe.

Summary

- A metatarsal fracture is a break in one of the five bones that connect the toes to the rest of the foot.
- Treatment depends on how severe your fracture is and how the pieces of the broken bone line up with each other (alignment). This may include wearing a cast, splint, or supportive boot, or using crutches. Sometimes surgery is needed to align the bones.
- Ice and elevate your foot to help lessen the pain and swelling.
- Make sure you know what symptoms should cause you to get help right away.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Ankle Fracture

Emergency Documentation

The ankle joint is made up of the lower (distal) sections of your lower leg bones (tibia and fibula) along with a bone in your foot (talus). An ankle fracture is a break in one, two, or all three of these sections of bone. There are two general types of ankle fractures:

- Stable fracture. This happens when one of your bones is broken, but the bones of your ankle joint stay in their normal positions.
- Unstable fracture. This type can include more than one broken bone. It can also happen if your outer bone is broken and the tough bands of tissue that connect bones (ligaments) are also injured at your inner ankle. This type of fracture allows the talus to move out of its normal position.

What are the causes?

This condition may be caused by:

- A hard, direct hit (blow) to the ankle.
- Quickly and severely twisting your ankle, often while your foot is planted and the rest of your body moving.
- Trauma, such as a car accident or falling from a height.

What increases the risk?

This condition is more likely to occur in people who:

- Smoke.
- Are overweight.
- Participate in sports that involve quick direction changes, as in soccer.
- Do high-impact sports like gymnastics or football.
- Are involved in a high-impact car accident.

What are the signs or symptoms?

Symptoms of this condition include:

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- Tender and swollen ankle.
- Bruising around the injured ankle.
- Pain when moving or pressing on the ankle.
- Trouble walking or using the ankle to support your body weight (putting weight on the ankle).
- Pain that gets worse when moving or standing and gets better with rest.

How is this diagnosed?

An ankle fracture is usually diagnosed with a physical exam and X-rays. A CT scan or MRI may also be done.

How is this treated?

Treatment for this condition depends on the type of ankle fracture you have. Stable fractures are treated with a cast, boot, or splint to hold the ankle still and crutches to avoid putting weight on the injured ankle until the fracture heals. Unstable fractures require surgery to ensure that the bones heal properly. After surgery, you will have a splint. After your incision is healed, your surgeon may give you a cast or a boot. You will not be able to put weight on your injured side for several weeks.

After your ankle has healed, you will do exercises to improve the strength and mobility of your ankle.

Follow these instructions at home:

If you have a splint:

- Wear the splint as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the splint if your toes tingle, become numb, or turn cold and blue.
- Keep the splint clean.
- If the splint is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk of infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:

Emergency Documentation

- **Do not** let it get wet.
- Cover it with a watertight covering when you take a bath or a shower.

Managing pain, stiffness, and swelling

- If directed, put ice on the injured area:
 - If you have a removable splint, remove it as told by your health care provider.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag or between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) the injured area above the level of your heart while you are sitting or lying down.

General instructions

- **Do not** use the injured limb to support your body weight until your health care provider says that you can. Use crutches as told by your health care provider
- Take over-the-counter and prescription medicines only as told by your health care provider.
- Ask your health care provider when it is safe to drive if you have a cast or splint.
- Do exercises as told by your health care provider.
- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have pain or swelling that gets worse or does not get better with rest or medicine.

Get help right away if:

- Your cast gets damaged.

Memorial Hospital

Patient Education Materials:

Metatarsal Fracture; Ankle Fracture

Metatarsal Fracture

A metatarsal fracture is a break in one of the five bones that connect the toes to the rest of the foot. This may also be called a forefoot fracture. A metatarsal fracture may be:

- A crack in the surface of the bone (stress fracture). This often occurs in athletes.
- A break all the way through the bone (complete fracture).

The bone that connects to the little toe (fifth metatarsal) is most commonly fractured. Ballet dancers often fracture this bone.

What are the causes?

A metatarsal fracture may be caused by:

- Sudden twisting of the foot.

Emergency Documentation

- Falling onto the foot.
- Something heavy falling onto the foot.
- Overuse or repetitive exercise.

What increases the risk?

This condition is more likely to develop in people who:

- Play contact sports.
- Do ballet.
- Have a condition that causes the bones to become thin and brittle (osteoporosis).
- Have a low calcium level.

What are the signs or symptoms?

Symptoms of this condition include:

- Pain that gets worse when walking or standing.
- Pain when pressing on the foot or moving the toes.
- Swelling.
- Bruising on the top or bottom of the foot.

How is this diagnosed?

This condition may be diagnosed based on:

- Your symptoms.
- Any recent foot injuries you have had.
- A physical exam.
- An X-ray of your foot. If you have a stress fracture, it may not show up on an X-ray, and you may need other imaging tests, such as:
 - A bone scan.
 - CT scan.
 - MRI.

How is this treated?

Treatment depends on how severe your fracture is and how the pieces of the broken bone line up with each other (alignment). Treatment may involve:

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- Wearing a cast, splint, or supportive boot on your foot.
- Using crutches, and **not** putting any weight on your foot.
- Having surgery to align broken bones (open reduction and internal fixation, ORIF).
- Physical therapy.
- Follow-up visits and X-rays to make sure you are healing.

Follow these instructions at home:

If you have a splint or a supportive boot:

- Wear the splint or boot as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the splint or boot if your toes tingle, become numb, or turn cold and blue.
- Keep the splint or boot clean.
- If your splint or boot is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk for infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

Activity

- **Do not** use your affected leg to support your body weight until your health care provider says that you can. Use crutches as directed.
- Ask your health care provider what activities are safe for you during recovery, and ask what activities you need to avoid.
- Do physical therapy exercises as directed.

Emergency Documentation

Driving

- **Do not** drive or use heavy machinery while taking pain medicine.
- **Do not** drive while wearing a cast, splint, or boot on a foot that you use for driving.

Managing pain, stiffness, and swelling

- If directed, put ice on painful areas:
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag.
 - If you have a removable splint or boot, remove it as told by your health care provider.
 - If you have a cast, place a towel between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) your lower leg above the level of your heart while you are sitting or lying down.

General instructions

- **Do not** put pressure on any part of the cast or splint until it is fully hardened. This may take several hours.
- Take over-the-counter and prescription medicines only as told by your health care provider.
- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider.
- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you may take showers.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if you have:

- Pain that gets worse or does not get better with medicine.

Emergency Documentation

- A fever.
- A bad smell coming from your cast or splint.

Get help right away if you have:

- Any of the following in your toes or your foot, even after loosening your splint (if applicable):
 - Numbness.
 - Tingling.
 - Coldness.
 - Blue skin.
- Redness or swelling that gets worse.
- Pain that suddenly becomes severe.

Summary

- A metatarsal fracture is a break in one of the five bones that connect the toes to the rest of the foot.
- Treatment depends on how severe your fracture is and how the pieces of the broken bone line up with each other (alignment). This may include wearing a cast, splint, or supportive boot, or using crutches. Sometimes surgery is needed to align the bones.
- Ice and elevate your foot to help lessen the pain and swelling.
- Make sure you know what symptoms should cause you to get help right away.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Ankle Fracture

Emergency Documentation

The ankle joint is made up of the lower (distal) sections of your lower leg bones (tibia and fibula) along with a bone in your foot (talus). An ankle fracture is a break in one, two, or all three of these sections of bone. There are two general types of ankle fractures:

- Stable fracture. This happens when one of your bones is broken, but the bones of your ankle joint stay in their normal positions.
- Unstable fracture. This type can include more than one broken bone. It can also happen if your outer bone is broken and the tough bands of tissue that connect bones (ligaments) are also injured at your inner ankle. This type of fracture allows the talus to move out of its normal position.

What are the causes?

This condition may be caused by:

- A hard, direct hit (blow) to the ankle.
- Quickly and severely twisting your ankle, often while your foot is planted and the rest of your body moving.
- Trauma, such as a car accident or falling from a height.

What increases the risk?

This condition is more likely to occur in people who:

- Smoke.
- Are overweight.
- Participate in sports that involve quick direction changes, as in soccer.
- Do high-impact sports like gymnastics or football.
- Are involved in a high-impact car accident.

What are the signs or symptoms?

Symptoms of this condition include:

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- Tender and swollen ankle.
- Bruising around the injured ankle.
- Pain when moving or pressing on the ankle.
- Trouble walking or using the ankle to support your body weight (putting weight on the ankle).
- Pain that gets worse when moving or standing and gets better with rest.

How is this diagnosed?

An ankle fracture is usually diagnosed with a physical exam and X-rays. A CT scan or MRI may also be done.

How is this treated?

Treatment for this condition depends on the type of ankle fracture you have. Stable fractures are treated with a cast, boot, or splint to hold the ankle still and crutches to avoid putting weight on the injured ankle until the fracture heals. Unstable fractures require surgery to ensure that the bones heal properly. After surgery, you will have a splint. After your incision is healed, your surgeon may give you a cast or a boot. You will not be able to put weight on your injured side for several weeks.

After your ankle has healed, you will do exercises to improve the strength and mobility of your ankle.

Follow these instructions at home:

If you have a splint:

- Wear the splint as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the splint if your toes tingle, become numb, or turn cold and blue.
- Keep the splint clean.
- If the splint is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk of infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:

Emergency Documentation

- **Do not** let it get wet.
- Cover it with a watertight covering when you take a bath or a shower.

Managing pain, stiffness, and swelling

- If directed, put ice on the injured area:
 - If you have a removable splint, remove it as told by your health care provider.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag or between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) the injured area above the level of your heart while you are sitting or lying down.

General instructions

- **Do not** use the injured limb to support your body weight until your health care provider says that you can. Use crutches as told by your health care provider
- Take over-the-counter and prescription medicines only as told by your health care provider.
- Ask your health care provider when it is safe to drive if you have a cast or splint.
- Do exercises as told by your health care provider.
- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have pain or swelling that gets worse or does not get better with rest or medicine.

Get help right away if:

- Your cast gets damaged.

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6503675

Emergency Documentation

- You have severe pain that lasts.
- You develop new pain or swelling.
- Your skin or toenails below the injury turn blue or gray, feel cold, become numb, or have a loss of sensitivity to touch.

Summary

- An ankle fracture can either be stable or unstable. This is determined after a physical exam and imaging studies like X-rays, a CT scan, or MRI.
- Stable fractures are treated with a cast, boot, or splint to hold the ankle still until the fracture heals. Unstable fractures require surgery to ensure that the bones heal properly.
- You will not be able to put weight on your injured side for several weeks.
- Pain medicines, icing, and raising (elevating) your injured ankle when sitting or lying down may help with pain relief. Follow instructions as told by your health care provider.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Follow-up Instructions:

With:

Address:

When:

Akande MD, Olusina

In 1 week, only if
needed

Comments:

Emergency Documentation

Tylenol and ibuprofen as needed for pain. Take it easy on your right knee. Follow-up with your primary care provider in 1 week if no improvement. Follow-up sooner or come to ER if worsening or new problems develop.

Patient Education Materials:

Acute Knee Pain, Adult

Acute Knee Pain, Adult

Many things can cause knee pain. Sometimes, knee pain is sudden (acute). It may be caused by damage, swelling, or irritation of the muscles and tissues that support your knee.

Pain may come from:

- A fall.
- An injury to the knee from twisting motions.
- A hit to the knee.
- Infection.

The pain often goes away on its own with time and rest. If the pain does not go away, tests may be done to find out what is causing the pain. These may include:

- Imaging tests, such as an X-ray, MRI, CT scan, or ultrasound.
- Joint aspiration. In this test, fluid is removed from the knee and checked.
- Arthroscopy. In this test, a lighted tube is put in the knee and an image is shown on a screen.
- A biopsy. In this test, a health care provider will remove a small piece of tissue for testing.

Follow these instructions at home:

If you have a knee sleeve or brace that can be taken off:

Emergency Documentation

- Wear the knee sleeve or brace as told by your provider. Take it off only if your provider says that you can.
- Check the skin around it every day. Tell your provider if you see problems.
- Loosen the knee sleeve or brace if your toes tingle, are numb, or turn cold and blue.
- Keep the knee sleeve or brace clean and dry.

Bathing

- If the knee sleeve or brace is not waterproof:
 - **Do not** let it get wet.
 - Cover it when you take a bath or shower. Use a cover that does not let any water in.

Managing pain, stiffness, and swelling

- If told, put ice on the area.
 - If you have a knee sleeve or brace that you can take off, remove it as told.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- If your skin turns bright red, take off the ice right away to prevent skin damage. The risk of damage is higher if you cannot feel pain, heat, or cold.
- Move your toes often to reduce stiffness and swelling.
- Raise the injured area above the level of your heart while you are sitting or lying down. Use a pillow to support your foot as needed.
- If told, use an elastic bandage to put pressure (compression) on your injured knee. This may control swelling, give support, and help with discomfort.
- Sleep with a pillow under your knee.

Activity

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

7585036

Emergency Documentation

- Rest your knee.
- **Do not** do things that cause pain or make pain worse.
- **Do not** stand or walk on your injured knee until you're told it's okay. Use crutches as told.
- Avoid activities where both feet leave the ground at the same time and put stress on the joints. Avoid running, jumping rope, and doing jumping jacks.
- Work with a physical therapist to make a safe exercise program if told. Physical therapy helps your knee move better and get stronger. Exercise as told.

General instructions

- Take your medicines only as told by your provider.
- If you are overweight, work with your provider and an expert in healthy eating, called a dietitian, to set goals to lose weight. Being overweight can make your knee hurt more.
- **Do not** smoke, vape, or use products with nicotine or tobacco in them. If you need help quitting, talk with your provider.
- Return to normal activities when you are told. Ask what things are safe for you to do.
- Watch for any changes in your symptoms.
- Keep all follow-up visits. Your provider will check your healing and adjust treatments if needed.

Contact a health care provider if:

- The knee pain does not stop.
- The knee pain changes or gets worse.
- You have a fever along with knee pain.
- Your knee is red or feels warm when you touch it.
- Your knee gives out or locks up.

Get help right away if:

- Your knee swells and the swelling gets worse.
- You cannot move your knee.
- You have very bad knee pain that does not get better with medicine.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Patient Education Materials

Orthopedics

Displaced Medial or Posterior Malleolar Ankle Fracture Treated With ORIF, Care After

This sheet gives you information about how to care for yourself after your procedure. Your health care provider may also give you more specific instructions. If you have problems or questions, contact your health care provider.

What can I expect after the procedure?

After the procedure, it is common to have:

- Pain.
- Swelling.
- A small amount of fluid from your incision.

Follow these instructions at home:

If you have a boot:

- Wear the boot as told by your health care provider. Remove it only as told by your health care provider.
- Loosen the boot if your toes tingle, become numb, or turn cold and blue.
- Keep the boot clean.
- If the boot is not waterproof:
 - **Do not** let it get wet.

Patient Education Notes

- Cover it with a watertight covering when you take a bath or a shower.

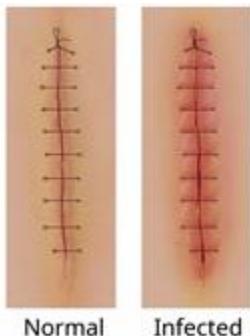

If you have a cast:

- **Do not** stick anything inside the cast to scratch your skin. Doing that increases your risk of infection.
- Check the skin around the cast every day. Tell your health care provider about any concerns.
- You may put lotion on dry skin around the edges of the cast. **Do not** put lotion on the skin underneath the cast.
- Keep the cast clean.
- If the cast is not waterproof:
 - **Do not** let it get wet.
 - Cover it with a watertight covering when you take a bath or a shower.

Bathing

- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you can take showers.
- If your boot or cast is not waterproof, cover it with a watertight covering when you take a bath or a shower.
- Keep the bandage (dressing) dry until your health care provider says it can be removed.

Incision care

- Follow instructions from your health care provider about how to take care of your incision. Make sure you:
 - Wash your hands with soap and water before you change your dressing. If soap and water are not available, use hand sanitizer.
 - Change your dressing as told by your health care provider.

Patient Education Notes

- Leave stitches (sutures), skin glue, or adhesive strips in place. These skin closures may need to stay in place for 2 weeks or longer. If adhesive strip edges start to loosen and curl up, you may trim the loose edges. **Do not** remove adhesive strips completely unless your health care provider tells you to do that.
- Check your incision area every day for signs of infection. Check for:
 - Redness.
 - More pain or swelling.
 - Blood or more fluid.
 - Warmth.
 - Pus or a bad smell.

Managing pain, stiffness, and swelling

- If directed, put ice on the affected area.
 - If you have a removable boot, remove it as told by your health care provider.
 - Put ice in a plastic bag.
 - Place a towel between your skin and the bag or between your cast and the bag.
 - Leave the ice on for 20 minutes, 2–3 times a day.
- Move your toes often to avoid stiffness and to lessen swelling.
- Raise (elevate) the injured area above the level of your heart while you are sitting or lying down. To do this, try putting a few pillows under your leg and ankle.

Driving

- **Do not** drive or use heavy machinery while taking prescription pain medicine.
- Ask your health care provider when it is safe to drive if you have a boot or cast on your foot.

Activity

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6505263

Patient Education Notes

- Return to your normal activities as told by your health care provider. Ask your health care provider what activities are safe for you.
- Do exercises as told by your health care provider or physical therapist.
- **Do not** use your injured limb to support (bear) your body weight until your health care provider says that you can. Follow weight-bearing restrictions as told. Use crutches or other devices to help you move around (assistive devices) as directed.

General instructions

- **Do not** put pressure on any part of the cast until it is fully hardened. This may take several hours.
- **Do not** use any products that contain nicotine or tobacco, such as cigarettes and e-cigarettes. These can delay bone healing. If you need help quitting, ask your health care provider.
- Take over-the-counter and prescription medicines only as told by your health care provider.
- If you are taking prescription pain medicine, take actions to prevent or treat constipation. Your health care provider may recommend that you:
 - Drink enough fluid to keep your urine pale yellow.
 - Eat foods that are high in fiber, such as fresh fruits and vegetables, whole grains, and beans.
 - Limit foods that are high in fat and processed sugars, such as fried or sweet foods.
 - Take an over-the-counter or prescription medicine for constipation.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have a fever.
- Your pain medicine is not helping.
- You have redness around your incision.
- You have more swelling or pain around your incision.
- You have blood or more fluid coming from your incision or leaking through your cast.
- Your incision feels warm to the touch.
- You have pus or a bad smell coming from your incision or dressings.

Get help right away if:

- The edges of your incision come apart after the stitches or staples have been taken out.
- You have chest pain.
- You have difficulty breathing.

Patient Education Notes

- You have numbness or tingling in your foot or leg.
- Your foot becomes cold, pale, or blue.

Summary

- After the procedure, it is common to have some pain and swelling.
- If your boot or cast is not waterproof, **do not** let it get wet.
- Contact your health care provider if you have severe pain or swelling, or if you have more fluids coming from your incision or leaking through your cast.
- Get help right away if you have numbness or tingling in your foot or leg, or if your foot becomes cold, pale, or blue.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Pharmacology

General Anesthesia, Adult, Care After

This sheet gives you information about how to care for yourself after your procedure. Your health care provider may also give you more specific instructions. If you have problems or questions, contact your health care provider.

What can I expect after the procedure?

After the procedure, the following side effects are common:

- Pain or discomfort at the IV site.
- Nausea.
- Vomiting.
- Sore throat.
- Trouble concentrating.
- Feeling cold or chills.
- Weak or tired.
- Sleepiness and fatigue.

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6505263

Patient Education Notes

- Soreness and body aches. These side effects can affect parts of the body that were not involved in surgery.

Follow these instructions at home:

For at least 24 hours after the procedure:

- Have a responsible adult stay with you. It is important to have someone help care for you until you are awake and alert.
- Rest as needed.
- **Do not:**
 - Participate in activities in which you could fall or become injured.
 - Drive.
 - Use heavy machinery.
 - Drink alcohol.
 - Take sleeping pills or medicines that cause drowsiness.
 - Make important decisions or sign legal documents.
 - Take care of children on your own.

Eating and drinking

- Follow any instructions from your health care provider about eating or drinking restrictions.
- When you feel hungry, start by eating small amounts of foods that are soft and easy to digest (bland), such as toast. Gradually return to your regular diet.
- Drink enough fluid to keep your urine pale yellow.
- If you vomit, rehydrate by drinking water, juice, or clear broth.

General instructions

Memorial Hospital

Name: BERRY, VICKIE L

MRN / FIN: 10502

6505263

Patient Education Notes

- If you have sleep apnea, surgery and certain medicines can increase your risk for breathing problems. Follow instructions from your health care provider about wearing your sleep device:
 - Anytime you are sleeping, including during daytime naps.
 - While taking prescription pain medicines, sleeping medicines, or medicines that make you drowsy.
- Return to your normal activities as told by your health care provider. Ask your health care provider what activities are safe for you.
- Take over-the-counter and prescription medicines only as told by your health care provider.
- If you smoke, **do not** smoke without supervision.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if:

- You have nausea or vomiting that does not get better with medicine.
- You cannot eat or drink without vomiting.
- You have pain that does not get better with medicine.
- You are unable to pass urine.
- You develop a skin rash.
- You have a fever.
- You have redness around your IV site that gets worse.

Get help right away if:

- You have difficulty breathing.
- You have chest pain.
- You have blood in your urine or stool, or you vomit blood.

Summary

- After the procedure, it is common to have a sore throat or nausea. It is also common to feel tired.
- Have a responsible adult stay with you for the first 24 hours after general anesthesia. It is important to have someone help care for you until you are awake and alert.
- When you feel hungry, start by eating small amounts of foods that are soft and easy to digest (bland), such as toast. Gradually return to your regular diet.
- Drink enough fluid to keep your urine pale yellow.

Education Note Caregiving

Sutures, Staples, or Adhesive Wound Closure

Wound closure refers to holding skin and underlying tissue together while it heals, such as after surgery or after an injury. Health care providers use stitches (sutures), staples, and special types of glue (skin adhesives) to close wounds. Your health care provider will use a wound closure method that helps you heal quickly and reduces the chances of infection or scarring. The type of wound closure depends on the location, size, and depth of your wound.

In most cases, wounds are closed as soon as possible (primary skin closure). Sometimes, closure is delayed so the wound can be cleaned and then can heal naturally over weeks or months (delayed wound closure). This reduces the chance of infection.

What are the different types of wound closure?

Adhesive glue

To use adhesive glue, your health care provider holds the edges of the wound together and paints the glue on the surface of your skin. You may need more than one layer of glue. Once the glue is dry, the wound may be covered with a dressing.

This type of skin closure may be used for small wounds that are not deep (superficial wounds). It is often used for children and on facial wounds. Adhesive glue is less painful than other methods of wound closure, and it does not require a medicine to numb the area (local anesthetic). This method also leaves nothing to be removed.

Adhesive glue cannot be used for wounds that are deep, uneven, or bleeding. It is not used inside of a wound.

Adhesive strips

These strips are made of paper that is sticky (adhesive) and has many small holes in it (is porous). They are applied across your wound edges like a regular bandage.

Patient Education Notes

Adhesive strips may be used to close very shallow wounds. They may be used along with sutures to improve skin closure.

Sutures

Sutures come in many different materials, strengths, and sizes. They may break down as your wound heals (absorbable), or they may need to be removed (nonabsorbable).

Your health care provider sews your skin or the tissues under your skin together with sutures and a steel needle. Your skin edges may be closed in one long (continuous) stitch or in separate stitches. Then the sutures are tied and cut.

Sutures can be used for all kinds of wounds. Absorbable sutures may be used to close tissues under the skin. Sutures can cause a skin reaction that can lead to infection.

Staples

When staples are used to close a wound, the edges of your skin on both sides of the wound are brought close together. A staple is placed across the wound, and an instrument secures the staple edges together.

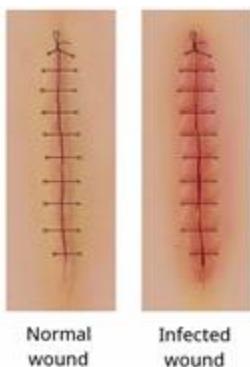

Staples are often used to close surgical incisions. They are faster to use than sutures, and they cause less skin reaction. Staples need to be removed using a tool that bends the staples away from your skin.

Follow these instructions at home:

Medicines

- Take over-the-counter and prescription medicines only as told by your health care provider.
- If you were prescribed an antibiotic medicine, take it as told by your health care provider. **Do not** stop taking the antibiotic even if you start to feel better.

Wound care

- Follow instructions from your health care provider about how to take care of your wound and dressing.

Patient Education Notes

- Wash your hands with soap and water before and after touching your wound or dressing. If soap and water are not available, use hand sanitizer.
- **Do not** try to remove your wound closures unless your health care provider tells you to do that. You may need a follow-up visit with your health care provider to remove your closures.
 - Wound closures may stay in place for 2 weeks or longer.
 - Absorbable sutures may dissolve after a few days or weeks.
 - If adhesive strip edges start to loosen and curl up, you may trim the loose edges.
- **Do not** pick at your wound. Picking can cause an infection.
- Apply ointments or creams only as told by your health care provider.
- Check your wound every day for signs of infection. Check for:
 - Redness, swelling, or pain.
 - Fluid or blood.
 - Warmth.
 - Pus or a bad smell.

General instructions

- **Do not** take baths, swim, or use a hot tub until your health care provider approves. Ask your health care provider if you may take showers. You may only be allowed to take sponge baths.
- **Do not** soak your wound in water.
- Keep all follow-up visits as told by your health care provider. This is important.

Contact a health care provider if you:

- Have a fever or chills.
- Have redness, swelling, or pain around your wound.
- Have fluid or blood coming from your wound.
- Notice that your wound feels warm to the touch.
- Notice pus or a bad smell coming from your wound.
- Notice that the edges of your wound start to separate after your sutures come out.
- Notice that your wound becomes thick, raised, and darker in color after your sutures come out (scarring).

Summary

Patient Education Notes

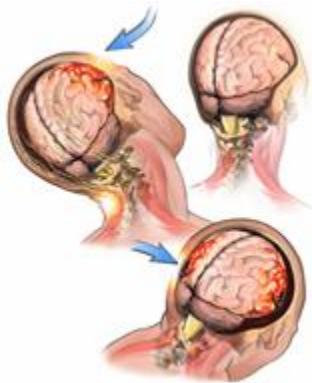

- The type of wound closure that your health care provider will use depends on the location, size, and depth of your wound. Options to close wounds include stitches (sutures), staples, special types of glue (skin adhesives), and adhesive strips.
- Your health care provider will use a wound closure method that helps you heal quickly and reduces the chances of infection or scarring.
- Do not** soak your wound in water. **Do not** take baths, shower, swim, or use a hot tub until your health care provider approves.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

Neurology

Head Injury, Adult

There are many types of head injuries. Head injuries can be as minor as a small bump, or they can be a serious medical issue. More severe head injuries include:

- A jarring injury to the brain (concussion).
- A bruise (contusion) of the brain. This means there is bleeding in the brain that can cause swelling.
- A cracked skull (skull fracture).
- Bleeding in the brain that collects, clots, and forms a bump (hematoma).

After a head injury, most problems occur within the first 24 hours, but side effects may occur up to 7–10 days after the injury. It is important to watch your condition for any changes. You may need to be observed in the emergency department or urgent care, or you may be admitted to the hospital.

*Patient Education Notes***What are the causes?**

There are many possible causes of a head injury. Serious head injuries may be caused by car accidents, bicycle or motorcycle accidents, sports injuries, falls, or being struck by an object.

What are the symptoms?

Symptoms of a head injury include a contusion, bump, or bleeding at the site of the injury. Other physical symptoms may include:

- Headache.
- Nausea or vomiting.
- Dizziness.
- Blurred or double vision.
- Being uncomfortable around bright lights or loud noises.
- Seizures.
- Feeling tired.
- Trouble being awakened.
- Loss of consciousness.

Mental or emotional symptoms may include:

- Irritability.
- Confusion and memory problems.
- Poor attention and concentration.
- Changes in eating or sleeping habits.
- Anxiety or depression.

How is this diagnosed?

This condition can usually be diagnosed based on your symptoms, a description of the injury, and a physical exam. You may also have imaging tests done, such as a CT scan or an MRI.

How is this treated?

Treatment for this condition depends on the severity and type of injury you have. The main goal of treatment is to prevent complications and allow the brain time to heal.

Mild head injury

Patient Education Notes

If you have a mild head injury, you may be sent home, and treatment may include:

- Observation. A responsible adult should stay with you for 24 hours after your injury and check on you often.
- Physical rest.
- Brain rest.
- Pain medicines.

Severe head injury

If you have a severe head injury, treatment may include:

- Close observation. This includes hospitalization with the following care:
 - Frequent physical exams.
 - Frequent checks of how your brain and nervous system are working (neurological status).
 - Checking your blood pressure and oxygen levels.
- Medicines to relieve pain, prevent seizures, and decrease brain swelling.
- Airway protection and breathing support. This may include using a ventilator.
- Treatments that monitor and manage swelling inside the brain.
- Brain surgery. This may be needed to:
 - Remove a collection of blood or blood clots.
 - Stop the bleeding.
 - Remove a part of the skull to allow room for the brain to swell.

Follow these instructions at home:**Activity**

- Rest and avoid activities that are physically hard or tiring.
- Make sure you get enough sleep.
- Let your brain rest by limiting activities that require a lot of thought or attention, such as:
 - Watching TV.
 - Playing memory games and puzzles.
 - Job-related work or homework.
 - Working on the computer, using social media, and texting.

Patient Education Notes

- Avoid activities that could cause another head injury, such as playing sports, until your health care provider approves. Having another head injury, especially before the first one has healed, can be dangerous.
- Ask your health care provider when it is safe for you to return to your regular activities, including work or school. Ask your health care provider for a step-by-step plan for gradually returning to activities.
- Ask your health care provider when you can drive, ride a bicycle, or use heavy machinery. Your ability to react may be slower after a brain injury. **Do not** do these activities if you are dizzy.

Lifestyle

- **Do not** drink alcohol until your health care provider approves. **Do not** use drugs. Alcohol and certain drugs may slow your recovery and can put you at risk of further injury.
- If it is harder than usual to remember things, write them down.
- If you are easily distracted, try to do one thing at a time.
- Talk with family members or close friends when making important decisions.
- Tell your friends, family, a trusted colleague, and work manager about your injury, symptoms, and restrictions. Have them watch for any new or worsening problems.

General instructions

- Take over-the-counter and prescription medicines only as told by your health care provider.
- Have someone stay with you for 24 hours after your head injury. This person should watch you for any changes in your symptoms and be ready to seek medical help.
- Keep all follow-up visits as told by your health care provider. This is important.

How is this prevented?

- Work on improving your balance and strength to avoid falls.
- Wear a seat belt when you are in a moving vehicle.
- Wear a helmet when riding a bicycle, skiing, or doing any other sport or activity that has a risk of injury.

Patient Education Notes

- If you drink alcohol:
 - Limit how much you use to:
 - 0–1 drink a day for nonpregnant women.
 - 0–2 drinks a day for men.
 - Be aware of how much alcohol is in your drink. In the U.S., one drink equals one 12 oz bottle of beer (355 mL), one 5 oz glass of wine (148 mL), or one 1½ oz glass of hard liquor (44 mL).
- Take safety measures in your home, such as:
 - Removing clutter and tripping hazards from floors and stairways.
 - Using grab bars in bathrooms and handrails by stairs.
 - Placing non-slip mats on floors and in bathtubs.
 - Improving lighting in dim areas.

Where to find more information

- Centers for Disease Control and Prevention: www.cdc.gov

Get help right away if:

- You have:
 - A severe headache that is not helped by medicine.
 - Trouble walking or weakness in your arms and legs.
 - Clear or bloody fluid coming from your nose or ears.
 - Changes in your vision.
 - A seizure.
 - Increased confusion or irritability.
- Your symptoms get worse.
- You are sleepier than normal and have trouble staying awake.
- You lose your balance.
- Your pupils change size.
- Your speech is slurred.
- Your dizziness gets worse.
- You vomit.

Patient Education Notes

These symptoms may represent a serious problem that is an emergency. Do not wait to see if the symptoms will go away. Get medical help right away. Call your local emergency services (911 in the U.S.). Do not drive yourself to the hospital.

Summary

- Head injuries can be minor, or they can be a serious medical issue requiring immediate attention.
- Treatment for this condition depends on the severity and type of injury you have.
- Have someone stay with you for 24 hours after your injury and check on you often.
- Ask your health care provider when it is safe for you to return to your regular activities, including work or school.
- Head injury prevention includes wearing a seat belt in a motor vehicle, using a helmet on a bicycle, limiting alcohol use, and taking safety measures in your home.

This information is not intended to replace advice given to you by your health care provider. Make sure you discuss any questions you have with your health care provider.

History and Physical Reports

WOUNDS: patient reports no wounds

NEUROVASCULAR: Sensation grossly intact

PALPATION: Tenderness over fracture sites

ROM: unable to assess

General Examination:

GENERAL APPEARANCE: alert and oriented to person, place, and time.

Doctor's Attestation for Scribe: The documentation recorded by the scribe accurately reflects the service I personally performed and the decisions made by me, Kral Varhan

Scribed on: 4/13/2022 11:32:26

Present in room for exam: Yes

Scribe Attestation: Documentation prepared by Laura Foerg, acting as medical Scribe for Dr. Varhan.

Assessment/Plan

1. Fracture of lateral malleolus of right ankle S82.61XA

2. Displaced fracture of fifth metatarsal bone, right foot, initial encounter for closed fracture S92.351A

Patient missed a step and twisted her right foot and ankle couple days ago. Initially she did not think much of it and she continued to walk but she had persistent right foot and ankle pain. X-rays in the emergency department revealed fracture of her foot and ankle and she was placed in a posterior splint. She had stroke in the past but she did not have any residual motor weakness. She is on Plavix because of her previous stroke. I reviewed her right foot and ankle x-rays. She has a fracture of lateral malleolus distally and comminuted and slightly displaced fracture of the base of her fifth Metatarsal. We discussed the operative and nonoperative options available. The nonoperative option would involve placing her in a walking boot and keeping her nonweightbearing 6 weeks to start with up to 3 months and following her closely with repeated x-rays. Operative option would involve placing a small plate and intramedullary screw in the distal fibula and placing an intramedullary screw into the fifth metatarsal. The rationale for the operative fixation involves stabilization of the fracture and allowing her to weight-bear early. Especially the base of the fifth metatarsal fracture involves an area with decreased blood supply and the pillar of the peroneus tendon is in the direction of distraction at the fracture site. The risks of the surgery include but not limited to infection, neurovascular injury, nonunion, malunion, and hardware problems. After discussing the pros and cons of each option she decided to go ahead with surgical treatment. Accordingly we are booking her surgery to be done early next week. She will stop her Plavix this weekend. [1]

There are no changes to the above history and physical examination as of April 22, 2022.

Medications

Inpatient

Lactated Ringers 1,000 mL, 1000 mL, IV Home

amLODIPine 5 mg oral tablet, 5 mg= 1 tab, Oral, Daily, 4 refills

Accession 16-MG-22-0002487	Exam Date/Time 7/20/2022 13:26 EDT	Exam MG Mammo Digital Screening Bilateral	Ordering Physician Akande MD,Olusina	Patient Age at Exam 69 years
-------------------------------	---------------------------------------	---	---	---------------------------------

Reason for Exam

(MG Mammo Digital Screening Bilateral) Screening mammogram

Radiology Report

EXAMINATION: MG MAMMO SCREENING BILAT + TOMO

Date: 7/20/2022 1:18 PM

History: Female, 69 years old. Screening mammogram

COMPARISON: February 10, 2020 and January 2, 2013

Technique: Routine screening 2D and 3D tomosynthesis were performed. CAD was utilized.

Density: The breast tissue is heterogeneously dense which could obscure small masses.

BILATERAL 2D and 3D SCREENING MAMMOGRAM FINDINGS: Benign bilateral breast calcifications. No suspicious calcifications or masses; no architectural distortion.

IMPRESSION: No mammographic evidence of malignancy. Annual screening mammograms along with monthly self-breast exams are recommended.

BI-RADS 2: Benign findings(s)

RECOMMENDATION: Annual screening mammography.

A letter is sent to the patient reporting the results of the exam.

Reason for Exam

(MG Mammo Digital Screening Bilateral) Breast Cancer Screening

Radiology Report

EXAMINATION: MG MAMMO SCREENING BILAT + TOMO

Date: 8/19/2024 11:28 AM

History: Female, 71 years old. Breast Cancer Screening Patient requesting appointment after 8/14/24.

COMPARISON: 2022, 2020, 2013

Technique: 2D and 3D mammography were performed in the CC and MLO projections. Computer-aided detection technique was utilized.

Density: There are scattered areas of fibroglandular density.

FINDINGS: No suspicious mass or calcifications; no architectural distortion.

IMPRESSION: No mammographic evidence of malignancy. Annual screening mammograms along with monthly self-breast exams are recommended. LTR 5.4%

BI-RADS 1: Negative.

MANAGEMENT RECOMMENDATION: Annual screening mammography.

A letter is sent to the patient reporting the results of the exam.

EXAMINATION: MRA HEAD INTRACRANIAL

Date: 9/30/2020 9:37 AM

History: Female, 67 years old. The patient has a history of prior CVA 2014.

COMPARISON: None.

Technique: Noncontrast MRA imaging of the brain; multiplanar and three-dimensional reformats performed.

FINDINGS:

INTRACRANIAL:

Brain: Unremarkable limited evaluation.

Extraaxial spaces: No subdural collections. Normal ventricles/cisterna.

Arteries: No arterial occlusion, arterial stenosis or intracranial aneurysm.

Venous structures: Unremarkable.

EXTRACRANIAL:

Orbits: Normal.

Bones/sinuses: Unremarkable.

Scalp/soft tissue: Unremarkable.

Additional comments: None.

IMPRESSION: The medium and large caliber intracranial vessels are within normal limits.

EXAMINATION: MRI BRAIN W/O CONTRAST

Date: 9/30/2020 9:37 AM

History: Female, 67 years old. Prior stroke in 2014. No complaints per patient recently. Follow-up.

COMPARISON: None.

Technique: Non-contrast MRI imaging of the brain.

FINDINGS:

Brain parenchyma: No masses, midline shift; no hemorrhage or acute infarct.

Diffusion: Unremarkable; no acute stroke.

Atrophy: None.

Microvascular: None.

Vessels: Unremarkable noncontrast appearance.

Extra-axial spaces: Normal for the patient's age.

Ventricles: No hydrocephalus; normal size for age.

Bones: Unremarkable calvarium and other visualized bony structures.

Sinuses and mastoids: Clear.

Soft tissues and scalp: Unremarkable.

Orbits (visible): Unremarkable.

Additional comments: None.

IMPRESSION: Normal MRI of the brain.

Office Clinic Notes

BACK examined, pale floppy papules on back - skin tags; hyperkeratotic papules on back - actinic keratoses treated with LN2 today.

NEURO/PSYCH normal mood/affect.

RIGHT UPPER EXTREMITY examined, hyperkeratotic papules on forearm - actinic keratoses treated with LN2 today; brown smooth macules on forearm - solar lentigines.

LEFT UPPER EXTREMITY examined, hyperkeratotic papules on forearm - actinic keratoses treated with LN2 today; brown smooth macules on forearm - solar lentigines.

RIGHT LOWER EXTREMITY

LEFT LOWER EXTREMITY

Assessment/Plan

1. AK (actinic keratosis) L57.0

Over 15 lesions destroyed with cryotherapy today. Reevaluate if any lesion not resolved.

2. Solar lentigo L81.4

Lesions without atypia discussed

3. Skin tag L91.8

Skin tag on back no symptoms reassurance given

4. Hx of basal cell carcinoma Z85.828

Patient has had basal cell carcinoma on the back and lip. We discussed the hypopigmentation that she has. Is no recurrence. These had been treated years ago 1 in Indianapolis and one in Kokomo

Procedure/Surgical History

- ORIF - Open reduction and internal fixation of fracture (04/19/2022)
- Colonoscopy (04/14/2008)
- Stroke
- Tonsillectomy

Medications

Chief Complaint

frequency of urination, hurts to urinate, had some pink coloring to toilet paper when she wiped, no fevers, symptoms started a couple of days ago

History of Present Illness

Patient is here with concern of possible UTI. States that she has had symptoms of dysuria and frequency for the past 3 days. She states that she called the office because she did notice that she had a pinkish discoloration on toilet paper when she wiped but no visible blood in her urine. She has had some lower back pain that is a little bit worse than her normal lower back pain but it does not seem to be on one side versus another. Patient denies fever, nausea, vomiting, diarrhea.

UA performed in office was positive for blood and leukocytes. I will treat patient for UTI based on this and patient symptoms. Vital signs reviewed in office and they are within normal limits. Patient has no further questions today.

Office Clinic Notes

General: Alert and oriented, well nourished, well-appearing, no acute distress.
Eye: PERRL, EOMI, normal conjunctiva.
HENT: Normocephalic, clear tympanic membranes, normal hearing, moist oral mucosa, no scleral icterus, no sinus tenderness.
Neck: Supple, non-tender, no carotid bruits, no JVD, no lymphadenopathy.
Lungs: Clear to auscultation, non-labored respiration.
Heart: Normal rate, regular rhythm, no murmur, gallop or edema.
Abdomen: Soft, non-tender, non-distended, active bowel sounds, no masses.
Musculoskeletal: Normal range of motion and strength, no tenderness or swelling.
Skin: Skin is warm, dry and pink, no rashes or lesions.
Neurologic: Awake, alert and oriented X4, CN II-XII intact.
Psychiatric: Cooperative, appropriate mood and affect.

Assessment/Plan

1. Urinary tract infection N39.0

UA performed in office and results listed in HPI. Urine will be sent for culture and patient will be called with culture results if they indicate that antibiotic may need to be ineffective. Bactrim DS ordered for patient to take twice daily x5 days. I also ordered Pyridium for patient's complaint of dysuria. Patient encouraged to push fluids, specifically water, and to take antibiotic as directed until completed. Patient advised that if she starts running fever, lower back pain worsens or seems to be one-sided versus another, or if she starts vomiting uncontrollably, then she needs to be seen. Advised patient on side effect profile of antibiotic as well as Pyridium. Patient verbalized understanding about all and has no further questions today.

Ordered:

Bactrim DS 800 mg-160 mg oral tablet, 1 tab, Oral, every 12 hr, # 10 tab, 0 Refill(s), Pharmacy: CVS/pharmacy #6534, 162.56, cm, 03/08/22 14:53:00 EST, Height

Dysuria R30.0

See above

Ordered:

 Akande MD, Olusina

Chief Complaint

High BP, 150's systolic this morning. Was much higher a couple months ago when she saw the nephrologist.

History of Present Illness

Patient consented to the use of Freed to record and transcribe notes during this visit.

Pt here for follow up on hypertension. Pt is a Dr Akande pt. Pt has appt with him in 3 weeks

Hypertension: BP found high during nephrologist visit 2 months ago. Home monitoring shows elevated readings, one instance of 190/113. Pt on amlodipine 5 mg and lisinopril 40 mg. Switched back to lisinopril from olmesartan 3 weeks ago due to cough concerns. Pt did this on her own. Pt states cough never changed stopping the lisinopril. No current lightheadedness, dizziness, or headaches.

Review of Systems

Chief Complaint

6 month follow up

History of Present Illness

HTN

Controlled

BPs at home are not measured.

Contributing/CAD risk factors: HLD, hypothyroidism.

Medications: Amlodipine, lisinopril. Side effects include none. Compliant
 Associated sxs: Denies CP, sudden increase in floaters, orthopnea, peripheral edema, urinary changes, decreased exercise tolerance, sudden weakness, dysarthria.

CVA

Had CVA in about 5 years ago.

No residual deficits.

No problems with diet.

On on statin, aspirin, and Plavix. Compliant.

No recent falls.

Blood pressure controlled.

Hypothyroidism

Pt is on levothyroxine.

Complaint with medication.

Side effects: None

Denies any fatigue, weight gain, cold intolerance, constipation, or dry skin.

GERD

Concerned about recurrent episodes of burning chest and epigastric pain

Famotidine does help a little bit but not very much.

Omeprazole does work however she is not taking it based off of some research

articles that were sent to her by her daughter.
Denies cough, SOB, sore throat, changes of taste.
No dysphagia.
No chest pain.

HLD
Compliant with statin.
No side effects.
Following a low-cholesterol diet.

Keratoconus
Patient states that she has to go to a corneal specialist in order to have her contacts made.
Has keratoconus a condition where her cornea is shaped like a cone instead of a sphere.

Aneurysms
Patient states that on head imaging she was recently found to have 2 aneurysms.
She follows with Dr. Lee in Indianapolis, further testing has shown that the aneurysms are stable.

Review of Systems

Office Clinic Notes

Assessment/Plan

1. Essential hypertension I10

Chronic, controlled.

Complicated by nothing.

Meds: No change in management

Labs: Future labs sent.

Imaging: EKG not on file

Counseled on lifestyle changes such as low salt diet, activity, and excess alcohol.

2. Gastro-esophageal reflux disease without esophagitis K21.9

Chronic, partially controlled.

Meds: Continue H2 therapy

No suspected reflux complications (barret/stricture).

Lifestyle: wt loss, avoid meals 2-3 hrs before bed.

3. Hypothyroidism, acquired, autoimmune E06.3

Chronic, stable

Labs: TSH sent.

Meds: Continue current medication.

Counseled on healthy activity and diet.

4. Mixed hyperlipidemia E78.2

Chronic, stable.

Most likely due to genetic expression.

ASCVD: Pending labs

Meds: No changes in management

Imaging: None.

Discussed healthy lifestyle.

5. History of CVA (cerebrovascular accident) without residual deficits Z86.73

Chronic.

Meds: Continue antiplatelet and statin

Referral: None

Continue to work towards optimal BP and glycemic control.

6. Aneurysm, cerebral I67.1

Subacute, stable.

Patient claims to have had aneurysms seen on imaging.

Most recent MRI and MRA reports do not mention anything about aneurysms.

Request for further documentation sent.

7. Keratoconus H18.609

Chronic

Has follow-up with corneal specialist to develop prescription contacts.

Patient to follow-up in 6 months for Medicare wellness.

Future Orders

Basic Metabolic Panel, Blood, Routine, *Est. 03/24/21, Once, Order for future visit,

 Akande MD, Olusina

Chief Complaint

6 month follow up

History of Present Illness

HTN
Controlled
BPs at home are not measured.
Contributing/CAD risk factors: HLD, hypothyroidism.

Medications: Amlodipine, lisinopril. Side effects include none. Compliant
Associated sxs: Denies CP, sudden increase in floaters, orthopnea, peripheral edema, urinary changes, decreased exercise tolerance, sudden weakness, dysarthria.

CVA
Had CVA around 2016
No residual deficits.
On statin, aspirin, and Plavix. Compliant.
No recent falls.
Blood pressure controlled.

Hypothyroidism
Pt is on levothyroxine.
Complaint with medication.
Side effects: None
Denies any fatigue, weight gain, cold intolerance, constipation, or dry skin.

GERD
Chronic reflux controlled with PPI.
Denies cough, SOB, sore throat, changes of taste.
No dysphagia.
No chest pain.

Problem List/Past Medical History

Ongoing
 Aneurysm, cerebral
 Constipation, unspecified
 Depression with anxiety
 Disease caused by 2019 novel coronavirus
 Essential hypertension
 Gastro-esophageal reflux disease without esophagitis
 Hemorrhoids
 History of colon polyps
 History of CVA (cerebrovascular accident) without residual deficits
 Hypothyroidism, acquired, autoimmune
 Iron deficiency anemia
 Keratoconus
 Mixed hyperlipidemia
 Other chronic pain

Historical

No qualifying data

Procedure/Surgical History

- Colonoscopy (04/14/2008)
- Stroke
- Tonsillectomy

Medications

amLODIPine 5 mg oral tablet, 5 mg= 1 tab,
Oral, Daily, 4 refills
aspirin 81 mg oral tablet, 81 mg= 1 tab, Oral,
Daily

Logansport Family

Name: BERRY, VICKIE L

MRN / FIN: 10502

6493896

Office Clinic Notes

HLD
Compliant with statin.
No side effects.
Following a low-cholesterol diet.

Keratoconus
Has keratoconus a condition where her cornea is shaped like a cone instead of a sphere.
Continues to follow-up with ophthalmology in order to get especially made contacts.

Aneurysms
Patient states that on head imaging she was recently found to have 2 aneurysms.
States that she did have a follow-up appointment with Dr. Reibold however she did not like him.
She was told that the aneurysms were small and she did not need to follow-up with him for 5 years.
She would like a another opinion to see if this is true.

Review of Systems

Constitutional: No fevers, chills, sweats
Eye: No recent visual problems
ENT: No ear pain, nasal congestion, sore throat
Respiratory: No shortness of breath, cough
Cardiovascular: No Chest pain, palpitations, syncope
Gastrointestinal: No nausea, vomiting, diarrhea
Genitourinary: No hematuria
Hema/Lymph: Negative for bruising tendency, swollen lymph glands
Endocrine: Negative for excessive thirst, excessive hunger
Musculoskeletal: No back pain, neck pain, joint pain, muscle pain, decreased range of motion
Integumentary: No rash, pruritus, abrasions
Neurologic: Alert & oriented X 4
Psychiatric: No anxiety, depression

Physical Exam

Vitals & Measurements
T: 36.5 °C (Oral) **HR:** 107(Peripheral) **RR:** 16 **BP:** 114/76 **SpO2:** 99%
HT: 162.56 cm **WT:** 79.9 kg **BMI:** 30
General: NAD, awake and conversant
Eyes: Normal conjunctiva, anicteric, round symmetric pupils
ENT: Hearing grossly intact, no nasal discharge
Neck: Neck is supple, no masses or thyromegaly
Pulm: Respirations are nonlabored, no wheezing
CV: No lower extremity edema
MSK: Normal ambulation, no clubbing or cyanosis
Skin: Warm, no rashes or ulcers
Neuro: Sensation and CN II - XII grossly normal
Psych: Alert and oriented, cooperative, appropriate mood and affect, normal judgment

Assessment/Plan

1. Aneurysm, cerebral I67.1
Chronic, stable.
Referral provided for second opinion with Dr. Du.
Ordered:

Bactrim DS 800 mg-160 mg oral tablet, 1 tab, Oral, every 12 hr
clopidogrel 75 mg oral tablet, 1 tab, Oral, Daily
FeroSul 325 mg (65 mg elemental iron) oral tablet, TAKE 1 TABLET BY MOUTH EVERY OTHER DAY
levothyroxine 100 mcg (0.1 mg) oral tablet, 1 tab, Oral, Daily
lisinopril 40 mg oral tablet, 1 tab, Oral, Daily
omeprazole 40 mg oral delayed release capsule, 40 mg= 1 cap, Oral, Daily, 3 refills
pravastatin 20 mg oral tablet, 1 tab, Oral, Daily
Pyridium 100 mg oral tablet, 100 mg= 1 tab, Oral, TID
trazodone 50 mg oral tablet, 4 tab, Oral, every day at bedtime, PRN
venlafaxine 150 mg oral capsule, extended release, 300 mg= 2 cap, Oral, Daily, 1 refills

Allergies

No Known Allergies
No Known Medication Allergies

Social History

Alcohol
Past
Electronic Cigarette/Vaping
Electronic Cigarette Use: Never.
Employment/School
Work/School description: home health aide.
Exercise
Physical Activity Intensity: Light. Sleep number of hours per night: 6. Self assessment: Fair condition.

Home/Environment

Marital Status of Patient if Patient Independent Adult: Married.-
Comments: Children: yes 3

Nutrition/Health

Diet: Vegetarian. Wants to lose weight: Yes.

Substance Use

Never
Tobacco
Tobacco Use: Are you a nonsmoker.
Exposure to Secondhand Smoke: No.
Smokeless Tobacco Use: Never.

Family History

Congestive heart failure: Mother.
Fire: Child.
Healthy adult: Sister and Brother.
Hypertension: Mother and Father.

Chief Complaint

6 month follow up

History of Present Illness

Vickie Berry is a 70-year-old female who presents to the office today for a follow-up visit. The patient has approved the use of DAX for the recording of this visit and creation of documentation.

Grief reaction

The patient recently lost her mother and father in the same week. She states that she is sleeping well. The patient states she has been emotional. She lost one of her two sons at 34-years-old, and her other son who just turned 34-years-old was diagnosed with Parkinson's disease, she states her son is doing well.

History of CVA

The patient continues to take clopidogrel.

Hyperlipidemia

The patient continues to take pravastatin.

Hypertension

The patient's blood pressure is stable.

Review of Systems

Constitutional: No fevers, chills, sweats

Eye: No recent visual problems

ENT: No ear pain, nasal congestion, sore throat

Respiratory: No shortness of breath, cough

Cardiovascular: No Chest pain, palpitations, syncope

Gastrointestinal: No nausea, vomiting, diarrhea

Genitourinary: No hematuria

Hema/Lymph: Negative for bruising tendency, swollen lymph glands

Endocrine: Negative for excessive thirst, excessive hunger

Musculoskeletal: No back pain, neck pain, joint pain, muscle pain, decreased range

Problem List/Past Medical History

Ongoing

Aneurysm, cerebral
 Anosmia
 Asymptomatic stenosis of intracranial artery
 Brain aneurysm
 Carotid stenosis
 Constipation, unspecified
 Depression with anxiety
 Essential hypertension
 Gastro-esophageal reflux disease without esophagitis
 Hemorrhoids
 History of CVA (cerebrovascular accident) without residual deficits
 Hypothyroidism, acquired, autoimmune
 Iron deficiency anemia
 Keratoconus
 Mixed hyperlipidemia
 Other chronic pain

Historical

Disease caused by 2019 novel coronavirus

Procedure/Surgical History

- ORIF - Open reduction and internal fixation of fracture (04/19/2022)
- Colonoscopy (04/14/2008)
- Stroke
- Tonsillectomy

Office Clinic Notes

of motion

Integumentary: No rash, pruritus, abrasions

Neurologic: Alert & oriented X 4

Psychiatric: No anxiety, depression

Physical Exam

Vitals & Measurements

T: 36.1 °C (Oral) HR: 106 (Peripheral) RR: 18 BP: 110/72 SpO2: 96%

HT: 162.56 cm WT: 81.0 kg BMI: 30.65 BSA: 1.91

General: NAD, awake and conversant

Eyes: Normal conjunctiva, anicteric, round symmetric pupils

ENT: Hearing grossly intact, no nasal discharge

Neck: Neck is supple, no masses or thyromegaly

Pulm: Respirations are nonlabored, no wheezing

CV: No lower extremity edema

MSK: Normal ambulation, no clubbing or cyanosis

Skin: Warm, no rashes or ulcers

Neuro: Sensation and CN II - XII grossly normal

Psych: Alert and oriented, cooperative, appropriate mood and affect, normal judgment

Assessment/Plan

1. Essential hypertension I10

Chronic, stable.

Complicated by patient's other comorbidities.

Meds: No change in management

Labs: Future labs sent.

Imaging: EKG is on file without signs of LVH.

Counseling: Lifestyle changes such as low salt diet, activity, and excess alcohol.

Ordered:

Basic Metabolic Panel, Blood, Routine, 04/05/23, Once, Lab Collect, Order for future visit, Essential hypertension | History of CVA (cerebrovascular accident) without residual deficits

CBC w/o Differential, Blood, Routine, 04/05/23, Once, Lab Collect, Order for future visit, Essential hypertension | History of CVA (cerebrovascular accident) without residual deficits

Hemoglobin A1c, Blood, Routine, 04/05/23, Once, Lab Collect, Order for future visit, Essential hypertension | History of CVA (cerebrovascular accident) without residual deficits

Lipid Panel, Blood, Routine, 04/05/23, Once, Lab Collect, Order for future visit, Essential hypertension | History of CVA (cerebrovascular accident) without residual deficits

Microalbumin/Creatinine Ratio Urine, Urine, Routine Collect, 04/05/23, Once, Lab Collect, Print Label, Order for future visit, Essential hypertension | History of CVA (cerebrovascular accident) without residual deficits

Scribe Attestation: Documentation prepared by Laura Foerg, acting as medical Scribe for Dr. Varhan.

Assessment/Plan

1. Fracture of lateral malleolus of right ankle S82.61XA
2. Displaced fracture of fifth metatarsal bone, right foot, initial encounter for closed fracture S92.351A

Patient missed a step and twisted her right foot and ankle couple days ago. Initially she did not think much of it and she continued to walk but she had persistent right foot and ankle pain.X-rays in the emergency department revealed fracture of her foot and ankle and she was placed in a posterior splint. She had stroke in the past but she did not have any residual motor weakness. She is on Plavix because of her previous stroke.I reviewed her right foot and ankle x-rays. She has a fracture of lateral malleolus distally and comminuted and slightly displaced fracture of the base of her fifth Metatarsal. We discussed the operative and nonoperative options available.The nonoperative option would involve placing her in a walking boot and keeping her nonweightbearing 6 weeks to start with up to 3 months and following her closely with repeated x-rays.Operative option would involve placing a small plate and intramedullary screw in the distal fibula and placing an intramedullary screw into the fifth metatarsal.The rationale for the operative fixation involves stabilization of the fracture and allowing her to weight-bear early.Especially the base of the fifth metatarsal fracture involves an area with decreased blood supply and the pull of the peroneus tendon is in the direction of distraction at the fracture site. The risks of the surgery include but not limited to infection, neurovascular injury, nonunion, malunion, and hardware problems.After discussing the pros and cons of each option she decided to go ahead with surgical treatment. Accordingly we are booking her surgery to be done early next week. She will stop her Plavix this weekend.

BERRY, VICKIE L

Chief Complaint

6 month follow up
discuss increasing anxiety medication and referral for counseling

History of Present Illness

Patient consented to the use of Freed to record and transcribe notes during this visit.

Vickie Berry, a 72-year-old female, presents for a six-month follow-up, primarily concerned about worsening anxiety. She reports feeling "miserable" and states she's "going nuts" due to her anxiety symptoms.

The patient describes that while her current medication helps with some symptoms, she continues to struggle with the "mental stuff." In an effort to address these ongoing issues, she has decided to seek counseling. She expresses a preference for a female therapist and mentions hearing positive things about Integrity in Kokomo.

Ms. Berry reports that her blood pressure was "really good today," suggesting an improvement in her cardiovascular health. She also notes changes in her foot size, stating that she used to wear size eight-and-a-half shoes but now wears seven-and-a-half. She questions the cause of this change, wondering if it's possible for feet to shrink or if shoe sizes are changing.

The patient acknowledges weight gain and expresses an intention to start walking for exercise. However, she reports getting out of breath easily, which concerns her children who advise her to slow down. This shortness of breath is impacting her ability to increase her physical activity.

Overall, Ms. Berry appears to be struggling with anxiety management despite medication, experiencing changes in her physical health including weight gain and shortness of breath, and is actively seeking additional mental health support through counseling.

Assessment/Plan

1. Depression with anxiety F41.8

Assessment: Patient reports ongoing anxiety symptoms despite medication management. The patient states she is "going nuts" and feels "miserable." She has decided to seek counseling to address the mental aspects of her condition. Current medication regimen appears to be partially effective in managing symptoms.

Logansport Family

Name: BERRY, VICKIE L

MRN / FIN: 10502

7564307

Office Clinic Notes

Plan:

- Maintain current anxiety medication regimen
- Refer patient to Integrity in Kokomo for counseling with a female therapist

2. Insomnia G47.00

Assessment: Patient denies current sleep issues. She reports taking 2 trazodone, which appears to be effective in managing her sleep disorder.

Plan:

- Continue current trazodone regimen
- Monitor for any changes in sleep patterns or medication effectiveness

3. Essential hypertension I10

Assessment: Patient's blood pressure was reported as "really good today," indicating well-controlled hypertension.

Plan:

- Continue current antihypertensive regimen
- Monitor blood pressure at future visits

Follow up:

- Patient to follow up in one year for routine evaluation and management of ongoing health issues.

BERRY, VICKIE L

Chief Complaint

6 mo follow up
 cough for past year

History of Present Illness

Vickie Berry is a 71-year-old female who presents in the clinic today for evaluation of multiple medical concerns. The patient consents to the use of DAX for the recording of this visit and the creation of documentation.

Cough.

She has been experiencing a persistent cough for over a year, initially manifesting as a sensation akin to being choked in air during laughter. The severity of the cough has escalated to the point of causing nocturnal awakenings. She also reports occasional dysphagia and is uncertain if this symptom is related to her cough. Occasionally, she expectorates phlegm. Her son has suggested the cough to be sensory and neuropathic in nature.

Blood pressure readings and weight gain.

Her blood pressure readings today are within the normal range. She attributes her hypertension to weight gain. She expresses a desire to lose weight but finds it challenging to maintain a sedentary lifestyle. She is currently prescribed lisinopril for hypertension.

Social history.

She has grandchildren.

Review of Systems

Constitutional: No fevers, chills, sweats

Eye: No recent visual problems

ENT: No ear pain, nasal congestion, sore throat

Respiratory: See HPI

Cardiovascular: No Chest pain, palpitations, syncope

Gastrointestinal: No nausea, vomiting, diarrhea

Genitourinary: No hematuria

Problem List/Past Medical History

Ongoing
 Aneurysm, cerebral
 Asymptomatic stenosis of intracranial artery
 Bilateral cataracts
 Carotid stenosis
 Cough
 Essential hypertension
 Gastro-esophageal reflux disease without esophagitis
 Hemorrhoids
 History of CVA (cerebrovascular accident) without residual deficits
 Hx of basal cell carcinoma
 Hypothyroidism, acquired, autoimmune
 Iron deficiency anemia
 Keratoconus
 Mixed hyperlipidemia
 Other chronic pain
 Prolonged grief disorder
 Vertigo

Historical

Disease caused by 2019 novel coronavirus

Procedure/Surgical History

- ORIF - Open reduction and internal fixation of fracture (04/19/2022)
- Colonoscopy (04/14/2008)
- Stroke
- Tonsillectomy

Logansport Family

Name: BERRY, VICKIE L

Office Clinic Notes

Hema/Lymph: Negative for bruising tendency, swollen lymph glands
Endocrine: Negative for excessive thirst, excessive hunger
Musculoskeletal: No back pain, neck pain, joint pain, muscle pain, decreased range of motion
Integumentary: No rash, pruritus, abrasions
Neurologic: Alert & oriented X 4
Psychiatric: No anxiety, depression

Physical Exam

Vitals & Measurements

T: 36.6 °C (Temporal Artery) HR: 96 (Peripheral) RR: 16 BP: 125/78 SpO₂: 99%
HT: 162.56 cm WT: 83.0 kg BMI: 31.41 BSA: 1.94

General: NAD, awake and conversant
Eyes: Normal conjunctiva, anicteric, round symmetric pupils
ENT: Hearing grossly intact, no nasal discharge
Neck: Neck is supple, no masses or thyromegaly
Pulm: Respirations are nonlabored, no wheezing
CV: No lower extremity edema
MSK: Normal ambulation, no clubbing or cyanosis
Skin: Warm, no rashes or ulcers
Neuro: Sensation and CN II - XII grossly normal
Psych: Alert and oriented, cooperative, appropriate mood and affect, normal judgment

Assessment/Plan

1. Cough R05.9

The condition is chronic and has been progressively worsening.
Assessment: It is likely that her use of lisinopril may be a contributing factor.
Further management will be determined based on her symptom improvement following the change in medication.
Meds: A switch from lisinopril to Olmesartan will be initiated to potentially alleviate her symptoms.
Labs: Screening labs have been ordered.
Imaging: N/A
Referral: N/A
Counseling: N/A

2. Essential hypertension I10

Chronic, controlled.
The hypertension is currently stable. The hypertension is likely secondary to her overall lifestyle. Complicated by patient's other comorbidities.
Meds: Lisinopril was discontinued, and she was started on Olmesartan to potentially alleviate her chronic cough.
Labs: Future labs sent.
Imaging: EKG is not on file.

Counseling: Lifestyle changes such as low salt diet, activity, and excess alcohol.

3. Hypothyroidism, acquired, autoimmune E06.3

Chronic, stable
Assessment: No changes in management will be made at this time.
Labs: A TSH test has been sent.
Meds: She will maintain her daily intake of levothyroxine 100 mcg.
Imaging: None
Counseling: Healthy activity and diet.

This note has been created using Dragon Ambient experience and was completed in the EHR by Marvin Miano.

Procedure

Post op dressings were removed and staples were taken out. Tall walking boot was put on.

Assessment/Plan

1. Aftercare following surgery Z48.89

She is here today for an ORIF of the right lateral malleolus and reduction internal fixation of the right fifth metatarsal. Patient is doing fairly well. She will remain nonweightbearing. She was put in a boot today. Staples were removed atraumatically. Patient will not shower her foot for 24 hours but will not submerge in water for at least 7 days. Patient will follow up in 4 weeks time with x-rays upon arrival.

2. Closed fracture of lateral malleolus of right ankle with routine healing S82.61XD

3. Displaced fracture of fifth metatarsal bone, right foot, subsequent encounter for fracture with routine healing S92.351D

Chief Complaint

Pt's nightgown caused scooter (used d/t Rt ankle/foot fx) to hit face when attempting to use BR. Steri-striped lac (approx 2cm) above Rt brow, 1cm lac below/outer aspect of Rt eye, 3mm lac to bridge of nose, contact rem'd PTA. No LOC. Pt is on Plavix.

History of Present Illness

Patient presents with lacerations to face. Patient reports symptoms started about 1-hour prior to arrival when her nightgown was caught up in her scooter wheel and her scooter struck her face. Patient reports lacerations to forehead, under right eye, and bridge of nose. Patient is on Plavix, denies loss of consciousness, was able to control bleeding after pressure for 40 minutes.

It has been over 5 years since patient's last Tdap, tetanus vaccine was given

Review of Systems

Constitutional: [denies fevers, chills, sweats, body aches]
 Eye: [denies recent visual problems]
 ENT: [denies ear pain, sore throat, rhinorrhea, nasal congestion, loss of taste or smell]
 Respiratory: [denies cough, wheezing, shortness of breath]
 Cardiovascular: [denies chest pain, palpitations, syncope]
 Gastrointestinal: [denies nausea, vomiting, diarrhea, abdominal pain]
 Genitourinary: [denies dysuria, hematuria, urinary frequency]

Office Clinic Notes

Eye: [PERRL, EOMI, normal conjunctiva].

HENT: [Normocephalic, contusion to forehead above right eyebrow, ecchymosis under right eye, to bridge of nose, and linear redness extending from under right eye to chin (appears to be a pattern contusion) septum was central, turbinates appeared normal, mild airflow restriction in nostrils, no rhinorrhea or blood present, TMs appeared shiny & healthy bilaterally without fluid in canal, pharynx appeared intact, no postnasal drip was identified].

Neck: [Supple, non-tender, no JVD, no lymphadenopathy].

Lungs: [Normal chest expansion, breath sounds are audible & normal bilaterally, lungs are clear to auscultation bilaterally].

Heart: [Normal rate, regular rhythm, no murmur, gallop or edema].

Skin: [There is a 2 cm laceration diagonally on forehead above medial eyebrow, a 1 cm skin tear over medial surface of zygomatic arch, and a 3 mm diameter abrasion to bridge of nose that is scabbed over].

Procedure

Procedure explained and consent obtained from patient. Wound was identified as 2 mm laceration above the right eyebrow. Anesthesia was obtained via local infiltration with 2 ml of 1% lidocaine. A sterile field was established. Wound was irrigated with 0.9% NS. Wound exploration reveals minimal depth with no foreign bodies or deep tissue injury noted. The wound edges were approximated with good alignment using 5 simple interrupted sutures with 5.0 Ethilon, Hemostasis was obtained Sterile technique was maintained throughout the duration of the procedure.

Sterile skin glue was applied to 1 mm skin tear under right eye over the surface of the zygomatic arch. The patient tolerated the procedures well without complication.

Assessment/Plan

1. Face lacerations S01.81XA

- See clinical media for capture

- Patient was advised to observe wounds for signs of infection, return in 5 to 6 days for suture removal

2. Fall at home W19.XXXA

- Safety information given to patient discussed not wearing loose clothing around wheels

3. Head injury S09.90XA

- Patient will not be staying alone tonight, husband will be home and patient will be observed for signs or symptoms of post head injury sequelae

4. Facial trauma S09.93XA

- Patient takes Plavix daily, head/facial CT to follow

Unspecified place in unspecified non-institutional (private) residence as the place of occurrence of the external cause Y92.009

Orders:

mupirocin 2% topical ointment, 1 app, Topical, TID, X 7 days, # 15 g, 0 Refill(s), Start Date: 05/13/22 16:16:00 EDT, Stop Date: 05/20/22 16:16:00 EDT, Pharmacy: CVS/pharmacy #6534

- Reviewed patient's PCP old records as well as Personal Social, Medical & Surgical History during the evaluation.

-Reviewed treatment and medications prescribed, results of head CT to be reviewed at a later time with possible changes to treatment.

- ORIF - Open reduction and internal fixation of fracture (04/19/2022)
- Application of short leg splint (calf to foot) (04/11/2022)
- Colonoscopy (04/14/2008)
- Stroke
- Tonsillectomy

Office Clinic Notes

05/13/22 17:15:00

EXAMINATION: CT HEAD W/O CONTRAST

Date: 5/13/2022 4:59 PM

History: Female, 69 years old. Facial trauma, blunt Contrast Documented? -- N/A Tech Notes: -- hit in head/face with scooter / pt states on blood thinners

COMPARISON: Brain MRI performed
9/30/2020

Technique: Noncontrast imaging of the head. One or more of these dose optimization techniques were utilized: Automated exposure control; mA and/or kV adjustment per patient size (includes targeted exams where dose is matched to clinical indication); or iterative reconstruction.

FINDINGS:

Intracranial: No mass effect or midline shift. No CT evidence of acute ischemia or infarction. No abnormal extra-axial collections. No acute intracranial hemorrhage. Negative for hydrocephalus. The basilar cisterns and foramen magnum are preserved.

Atrophy/white matter: Age appropriate cerebral volume and white matter.

Scalp and soft tissues: No acute findings. Orbita (visible): Unremarkable.

Sinuses and mastoids: A small amount of fluid is seen within the left maxillary sinus. Clear mastoid air cells.

Bones: Unremarkable calvarium and other visualized bony structures.

Additional comments: None.

IMPRESSION: No acute intracranial pathology is identified.

Chief Complaint

Cough x 2 weeks, Yellow nasal drainage, ears popping ; thinks she has a sinus infection

History of Present Illness

Pt is here stating she has a cough for 2 weeks with some yellow nasal drainage and ears popping -states that she thinks she has a sinus infection. About halfway through dosing her symptoms with the patient, she states that she tried to smell her Bath & Body Works hand sanitizer and could not even smell it at all because her head is so stuffed up. After discussing that that is a symptom of coronavirus, pt reluctantly agrees to a COVID-19 test. After the swab comes back negative, patient states that she can now smell and taste but had lost both approximately 1 week ago. Denies SOB.

Review of Systems

See HPI ROS all others reviewed and negative except for those mentioned in HPI.

Physical Exam

Vitals & Measurements

T: 98.7 °F (Oral) **HR:** 92(Apical) **RR:** 16 **BP:** 137/90 **SpO2:** 100%
HT: 162.56 cm **WT:** 74.21 kg **BMI:** 28

General: alert and oriented x3, well-nourished, in no acute distress, cooperative

Eye: PERRL, EOMI, normal conjunctiva, no discharge or drainage noted

HENT: Normocephalic, atraumatic. Normal hearing, moist oral mucosa, no sinus tenderness

Neck: supple, non-tender, no lymphadenopathy

Abdomen: soft, non-tender, non-distended, no masses

Musculoskeletal: Normal range of motion and strength, normal gait

Skin: warm, dry and pink, no rash or lesions noted

Extremities: no edema

Office Clinic Notes

Assessment/Plan

1. Loss of perception for smell R48.1, Loss of perception for taste R48.1

Discussed with patient that she likely had COVID-19, but should no longer be contagious since it has been 2+ weeks since her initial symptoms; pt verbalized understanding. Recommended Tylenol for fever, body aches. Discussed symptom control and recommended cool-mist humidifier at bedside, sleeping prone and/or practicing prone positioning several times daily, salt water gargles, warm tea with honey, increased fluid intake, and rest. May take Vitamin C 1000mg daily, Zinc 50-100mg daily, probiotics, Vitamin D 5,000 units daily, and ASA 81mg daily. Pt to go to ER for worsening SOB, SOB at rest, or difficulty breathing; pt voiced understanding once again.

Ordered:

Office Clinic Notes

PALPATION: minimal tenderness upon palpation on ATFL

Assessment/Plan

1. Aftercare following surgery Z48.89

After assessment, x-rays were reviewed. Patient will now begin toe touching weightbearing. She will use crutches to help weight bear toe touching. She will follow-up in 4 weeks time with x-rays upon arrival. At that time Dr. Varhan is hopeful that the patient will weight-bear in her boot. We will follow-up sooner if problems arise. We will continue her home exercises as discussed at last appointment.

Ordered:

XR Ankle Complete 3+ Views Right, 06/22/22 10:31:00 EDT, Routine, Reason: aftercare following surgery, Transport Mode: Ambulatory, Aftercare following surgery

Chief Complaint

New pt - Here today to establish. Hx of stroke about 5 years ago. Recent images showed 2 brain aneurysms. Pt states other neurologist are giving her different information. Pt states no other sx. Dr. Akande referring.

Problem List/Past Medical History

Ongoing

- Aneurysm, cerebral
- Brain aneurysm
- Constipation, unspecified
- Depression with anxiety
- Disease caused by 2019 novel coronavirus
- Essential hypertension
- Gastro-esophageal reflux disease without esophagitis
- Hemorrhoids
- History of colon polyps
- History of CVA (cerebrovascular accident) without residual deficits
- Hypothyroidism, acquired, autoimmune
- Iron deficiency anemia
- Keratoconus
- Mixed hyperlipidemia
- Other chronic pain

Historical

No qualifying data

Procedure/Surgical History

- Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed (04/19/2022)
- Open treatment of metatarsal fracture, includes internal fixation, when performed, each (04/19/2022)

History of Present Illness

New pt - Here today to establish. Hx of stroke about 5 years ago. Recent images showed 2 brain aneurysms. Pt states other neurologist are giving her different information. Pt states no other sx. Dr. Akande referring.

Brain in May 13 was normal.

She is here for brain aneurysm.

3 years ago she was told that if she has no brain aneurysm with neurosurgeon. Patient saw Dr. Lee and was told that she has 2 small aneurysms 4 years.

Patient saw Dr. Riebe all which made her cry and told that she does have brain aneurysm but there is no problem.

So she is trying to get another opinion

We reviewed what is the maximized and we can do

She has some history of a stroke 80 years ago and was seen in Parkview

For the stroke she is taking aspirin and Plavix I reviewed risks

Office Clinic Notes

PALPATION: no tenderness

ROM: Dorsiflexion is 3* and Plantarflexion is 25*

General Examination:

GENERAL APPEARANCE: alert and oriented, place, person, and time.

Doctor's Attestation for Scribe: The documentation recorded by the scribe accurately reflects the service I personally performed and the decisions made by me, Kral Varhan

Scribed on: 8/10/2022 10:38:10

Present in room for exam: Yes

Scribe Attestation: Documentation prepared by Alexis Dilsaver, RMA acting as medical Scribe for Dr. Varhan.

Assessment/Plan

1. Fracture of lateral malleolus of right ankle S82.61XA

2. Displaced fracture of fifth metatarsal bone, right foot, subsequent encounter for fracture with routine healing S92.351D

3. Aftercare following surgery Z48.89

Patient was seen today in regards to her right ankle fracture. She does not have any pain. I reviewed her x-rays and her fracture is healed in good position. On examination however there was quite a bit of swelling of her right foot and there was some redness and warmth throughout her foot. She will stop wearing her walking boot and ambulate with regular shoes. I will see her in 2 weeks time just to make sure that the redness and swelling is resolving. Does not need any x-rays of her ankle at that time. If she continues to have redness we may need to work her up with blood work for possible infection and cellulitis. I asked Jamie Ross to see her foot today and she told me that her foot did not look the way it looked today when she saw her last time.

- ORIF - Open reduction and internal fixation of fracture (04/19/2022)
- Application of short leg splint (calf to foot) (04/11/2022)
- Colonoscopy (04/14/2008)
- Stroke
- Tonsillectomy

Logan Internists

Name: BERRY, VICKIE L

MRN / FIN: 10502

6635689

Office Clinic Notes

Internal carotid arteries: Vascular plaque is present involving the cavernous portions of the ICAs. The degree of stenosis is estimated at less than 50% bilaterally.
on lipid med

on asa/plavix after cva and on lipitor, now only plavix

1. Mild plaque within the proximal right internal carotid artery. Doppler velocity measurements indicate no hemodynamically significant stenosis (less than 50% diameter stenosis). No change in carotid stenosis from prior study.

2. Mild to moderate plaque within the proximal left internal carotid artery. Doppler velocity measurements indicate no hemodynamically significant stenosis (less than 50% diameter stenosis). No change in carotid stenosis from prior study.

Office Clinic Notes

Cancer screening

Colon Ca (50-75; 40 w/ FDR or 10 yr before): Due, has been having issues with painful hemorrhoids and would like to get this taken care of prior to having a colonoscopy. She previously saw a surgeon who performed banding twice which did not work. Would like a referral to Dr. Lalla.

History of breast cancer, ductal carcinoma, lobar carcinoma: No

History of radiation therapy to the chest: No

History of BRCA 1 or 2: No

History of gene mutation associated with breast cancer: No

Mammogram (50-75; 40 w/ increased risk): Due

Hepatitis B/C screening

Born between 46-66: No

Born in the US: Yes

Parents born in the US: Yes

Osteoporosis screening: Low risk, walks often

(>65 w/o risk; <65 + 10 yr fx risk)

Vaccines

Influenza (October - April): Due

Zoster (> 60): Up-to-date

Pneumonia (> 65, DM/COPD/asthma/CHF): Due

Functional Ability and Level of Safety:

See intake for ADLs, fall risk, hearing impairment, home safety, and functional capacity.

There are no concerning findings.

Potential Risk Factors for Depression and Other Mood Disorders:

See intake. There are no concerning findings.

GERD

Concerned about recurrent episodes of burning chest and epigastric pain
Currently on famotidine which does not control her symptoms.

Was previously on Prilosec which worked very well.

No dysphagia.

No chest pain.

Review of Systems

Constitutional: No fevers, chills, sweats

Eye: No recent visual problems

ENT: No ear pain, nasal congestion, sore throat

Respiratory: No shortness of breath, cough

Cardiovascular: No Chest pain, palpitations, syncope

Gastrointestinal: No nausea, vomiting, diarrhea

Genitourinary: No hematuria

Hema/Lymph: Negative for bruising tendency, swollen lymph glands

Endocrine: Negative for excessive thirst, excessive hunger

clopidogrel 75 mg oral tablet, 75 mg= 1 tab,
Oral, Daily, 3 refills, TAKE ONE TABLET BY MOUTH ONCE DAILY

FeroSul 325 mg (65 mg elemental iron) oral tablet, TAKE 1 TABLET BY MOUTH EVERY OTHER DAY

levothyroxine 100 mcg (0.1 mg) oral tablet, 100 mcg= 1 tab, Oral, Daily, 3 refills, Take 1 tablet every day

lisinopril 40 mg oral tablet, 1 tab, Oral, Daily
omeprazole 40 mg oral delayed release capsule, 40 mg= 1 cap, Oral, Daily, 3 refills

pravastatin 20 mg oral tablet, 20 mg= 1 tab,
Oral, Daily, 3 refills, TAKE ONE TABLET BY MOUTH ONCE DAILY

trazodone 50 mg oral tablet, 4 tab, Oral,
every day at bedtime, PRN

venlafaxine 150 mg oral capsule, extended release, See Instructions, 3 refills, Two Capsules every day

Visit Date: 10/08/2024
Primary Care Physician:
 Akande MD, Olusina

Chief Complaint

Telehealth
 no concerns at this time
 No way to do vitals

History of Present Illness

The patient is a 71-year-old female who presents for an audio visit.

This appointment was conducted utilizing an audio-only phone visit that permits communication between the patient and provider. Verbal consent was obtained from the patient to perform the encounter on 10/08/2024 and any questions about the visit were answered.

The patient reports that she has no significant concerns at this time. She has noticed that she can walk at a fairly brisk pace for a few miles without getting short of breath; however, she is curious as to why whenever she walks to pick up toys out of the yard that she starts to get short of breath. It was explained to the patient that picking up toys requires the use of muscles such as her lower back and her abdominals, which are likely not used as much whenever she is simply just walking.

Review of Systems

Constitutional: No fevers, chills, sweats
 Eye: No recent visual problems
 ENT: No ear pain, nasal congestion, sore throat
 Respiratory: Positive for shortness of breath.
 Cardiovascular: No Chest pain, palpitations, syncope
 Gastrointestinal: No nausea, vomiting, diarrhea
 Genitourinary: No hematuria
 Hema/Lymph: Negative for bruising tendency, swollen lymph glands
 Endocrine: Negative for excessive thirst, excessive hunger
 Musculoskeletal: No back pain, neck pain, joint pain, muscle pain, decreased range of motion
 Integumentary: No rash, pruritus, abrasions

Office Clinic Notes

Neurologic: Alert & oriented X 4
Psychiatric: No anxiety, depression

Physical Exam

Vitals & Measurements

Deferred: audio visit

Assessment/Plan

1. Essential hypertension I10

Chronic, controlled.

Complicated by patient's other comorbidities, most likely complicated by the patient's lifestyle along with her history of CVA.

Meds: No current changes in management. The patient will continue to take amlodipine and olmesartan.

Labs: Future labs have been sent.

Imaging: EKG is not on file.

Counseling: Lifestyle changes such as low salt diet, activity, and excess alcohol.

2. History of CVA (cerebrovascular accident) without residual deficits Z86.73

Chronic, stable.

No changes in management. The patient will continue to take pravastatin.

3. CKD stage G3b/A1, GFR 30-44 and albumin creatinine ratio <30 mg/g N18.32

New diagnosis, uncontrolled.

Meds: N/A

Labs: On the review of the patient's labs and history, there does seem to be a slow increase in her creatinine with a decrease in her GFR. A repeat BMP has been sent.

Imaging: N/A

Referral: N/A

Counseling: N/A

4. Depression with anxiety F41.8

Chronic, stable.

The patient will continue to take venlafaxine.

5. Peripheral vascular disease, unspecified I73.9

The patient does have a history of CVA but has never had a diagnosis of peripheral vascular disease.

Orders:

traZODone 50 mg oral tablet, 4 tab, Oral, every day at bedtime, PRN AS NEEDED FOR SLEEP, # 360 tab, 3 Refill(s), Start Date: 10/10/24 16:09:00 EDT, Pharmacy: Optum Home Delivery, 162.56, cm, 04/29/24 9:02:00 EDT, Height, 83, kg, 04/29/24 9:07:00 EDT, Weight Dosing

This was a 5 min telemedicine visit via real-time video/audio, over half in discussion of the diagnosis, treatment plan, and follow up.

Future Orders

Basic Metabolic Panel, Blood, Routine, 10/08/24, Once, Lab Collect, Order for future visit, Essential hypertension | History of CVA (cerebrovascular accident) without residual deficits | CKD stage G3b/A1, GFR 30-44 and albumin creatinine ratio <30 mg/g

Chief Complaint

Hemorrhoids

History of Present Illness

Patient is a 68-year-old female presenting for consultation for hemorrhoids. Patient has had banding of her hemorrhoids before which did not help. I did ask the patient if she takes any fiber supplements. She does not. We then discussed the relationship between fiber intake and hemorrhoid disease. Patient also noted that she is overdue for a colonoscopy. Her last colonoscopy was about 6 years ago and she had several polyps removed. She would like to have a colonoscopy performed. She denies any family history of colon cancer. She denies any significant amount of blood in her stool. She denies any significant weight loss.

Office Clinic Notes

HT: 162.56 cm **WT:** 78.11 kg **BMI:** 30

HEENT the patient's extraocular muscles are intact. The patient's cranial nerves are intact. Patient has intact hearing to light sound on both sides. Eyes the patient's pupils are equally round and reactive to light. Extraocular muscles are intact. Neck is supple with no masses or bruits. There is no adenopathy. There is no JVD. Thyroid is palpably normal with no masses. Thyroid rises and falls normally on swallowing. Chest reveals good breath sounds bilaterally. No rales or rhonchi. Symmetric rise and fall of chest bilaterally. Heart is of regular rate and rhythm. There are no gallops rubs or murmurs. There is no palpable cardiac thrill. There is a normal radial and carotid pulse. Abdomen is soft nontender and nondistended. There is no organomegaly on exam. There are no hernias on exam. There are normal bowel sounds. Extremities are warm normal palpable pulses.

Assessment/Plan

1. Hemorrhoids K64.9

Patient's initial complaint and presentation was for hemorrhoidal disease. Patient has had hemorrhoidal disease for about 10 years. Patient does not take any fiber supplements. I have advised the patient to start taking fiber supplements. This will help bulk up her stool and make her incidence of symptomatic hemorrhoidal disease decrease. Patient also understands it may take 2 to 3 months before the fiber starts having any significant effect.

2. History of colon polyps Z86.010

The patient also has a history of colon polyps on her last colonoscopy was about 6 years ago. I have recommended a high risk screening colonoscopy to the patient. I have explained the procedure and its risks in great detail and provided the patient with written literature on the same. The risks of the procedure include but are not limited to post procedure bleeding, infection and perforation. This could necessitate exploration through a laparotomy or thoracotomy with repair resection or diversion of any injured area in the form of an ostomy. There is a chance of false negative exam meaning that there possibly would be a lesion that would not be visualized at the time of endoscopy. This could delay the discovery of this lesion and possibly have negative consequences for the patient. There is a chance of incomplete visualization of the colon. This could necessitate completion radiologic studies. The patient understands this and wishes to proceed.

Follow Up Instructions

No qualifying data available

clopidogrel 75 mg oral tablet, 1 tab, Oral, Daily

FeroSul 325 mg (65 mg elemental iron) oral tablet, TAKE 1 TABLET BY MOUTH EVERY OTHER DAY

levothyroxine 100 mcg (0.1 mg) oral tablet, 1 tab, Oral, Daily

lisinopril 40 mg oral tablet, 1 tab, Oral, Daily

omeprazole 40 mg oral delayed release capsule, 40 mg= 1 cap, Oral, Daily, 3 refills

pravastatin 20 mg oral tablet, 1 tab, Oral, Daily

traZODone 50 mg oral tablet, 4 tab, Oral, every day at bedtime, PRN

venlafaxine 150 mg oral capsule, extended release, See Instructions, 3 refills, Two Capsules every day

 Akande MD, Olusina

Date/Time Surgery Performed

April 19, 2022

Indication for Surgery

Patient is a 69-year-old woman who had a fall and she suffered right Lateral malleolus fracture as well as base of fifth metatarsal fractures. She now comes in for the operative treatment of her injuries. She understood the rationale, benefits and risks of surgery.

Preoperative Diagnosis

- 1) Right lateral malleolus fracture
- 2) Right fifth metatarsal base fracture

Postoperative Diagnosis

- 1) Right lateral malleolus fracture
- 2) Right fifth metatarsal base fracture

Operation

- 1) Open reduction and internal fixation of right lateral malleolus (CPT code 27792)
- 2) As a separate procedure, Reduction internal fixation of right fifth metatarsal (CPT code 28485-59)

Technique Patient was brought into the operating room and given general anesthesia. We placed a tourniquet on her right thigh and placed a sandbag underneath her right buttock. We then prepped and draped her right lower extremity in usual sterile manner.

I then applied Esmarch bandage and inflated tourniquet to 350 mmHg. A straight lateral incision was made over the distal fibula measuring approximately 7 cm. Soft tissues were dissected and the fracture was exposed. The fracture was reduced. This was done by direct visualization as well as using fluoroscopy. I then utilized a hook plate. Using the metal of long haul I initially placed a cortical screw. However her bone was very soft and the cortex of the screw did not have a good purchase. I changed the screw to a shorter and cancellous screw. I placed a cortical screw in the most proximal oblong hole. I then loosened the screws and applied impaction distally over the hook portion of the plate and then tightened the screws. This maneuver dug the hooks of the plate further into the distal portion of the fibula. I then placed a cancellous screw running intramedullary from the most distal hole of the hook plate. This last screw applied compression at the fracture site. I then visualized the adequacy of the reduction and fixation and with anatomic reduction. This was done by direct visualization as well as using fluoroscopy.

I then made a second incision centering over the base of the fifth metatarsal. Soft tissues were carefully dissected and the fracture and the base of the fifth metatarsal was exposed. The fracture was then reduced. I used cannulated 4.0 screw to fix the fracture. Partially-threaded 34 mm screw was placed through guidewire. As I placed this partially-threaded screw the fracture was then compressed with the application of the screw. The position of the fixation was checked by direct visualization as well as using fluoroscopy. We had a nice reduction of the fracture.

I washed both incisions laterally and closed them using 2-0 Vicryl for subcutaneous layers and staples for the skin. I then applied Xeroform and then bulky dressing on top. I then placed her leg in a short leg splint with a sugar-tong to prevent plantar flexion. Tourniquet was taken down and her toes puffed up nicely.

Anesthesia was reversed and the patient was transferred to the recovery room in stable condition.

Postoperatively she will remain nonweightbearing for the next 2 months. She will be seen by Jamie Ross in 2 weeks time and at that time staples will be removed and she will be placed in a walking boot but she will remain nonweightbearing. She will get x-rays of her ankle and foot each postoperative visit. This includes 2-week postop visit with x-rays of her ankle and foot. She will then be seen 2 months postoperatively by Jamie Ross with x-rays upon arrival. At that point she will start touch weightbearing with her right lower extremity. I will see her on or after July 25, 2022. At that point she will start weightbearing as tolerated with her walking boot.

Kral Varhan MD, FRCSC

Subjective

Hx of stroke about 5 years ago. Recent images showed 2 brain aneurysms. Pt states other neurologist are giving her different information. Pt states no other sx. Dr. Akande referring.

saw neuro S and told no aneurysm

IMPRESSION:

1. No obvious intracranial aneurysm demonstrated on this study. No aneurysms are identified on previous imaging. If the patient has outside imaging demonstrating an aneurysm, we would be happy to review that study and compare to the current exam to discuss a possible very small aneurysm not well demonstrated on this exam.

2. Vascular disease involving the cavernous portions of the ICAs without evidence of a greater than 50% stenosis.

Internal carotid arteries: Vascular plaque is present involving the cavernous portions of the ICAs. The degree of stenosis is estimated at less than 50% bilaterally.

on lipid med

on asa/plavix after cva and on lipitor

if casrotid ok then only need plavix

Ultrasound

Accession 16-US-22-0007960	Exam Date/Time 9/9/2022 12:56 EDT	Exam US Carotid Duplex Bilateral	Ordering Physician Du MD,Cheng	Patient Age at Exam 69 years
-------------------------------	--------------------------------------	--	-----------------------------------	---------------------------------

Reason for Exam

(US Carotid Duplex Bilateral) dizzy et al

Radiology Report

EXAMINATION: US CAROTIDS, BILATERAL

DATE OF EXAM: 9/9/2022 10:55 AM

CURRENT HISTORY: Female, 69 years old. The patient complained of dizziness. History of hyperlipidemia and hypertension.

PREVIOUS HISTORY: As above.

TECHNIQUE: Grayscale, color Doppler, and pulse wave Doppler analysis of both right and left carotid system(s).

COMPARISON: Carotid ultrasound 9/30/2020.

FINDINGS:

Internal carotid stenosis estimations are based on velocities using Society of Radiologists in Ultrasound (SRU) criteria.

RIGHT CAROTID SYSTEM:

ICA peak systolic velocity: 66 cm/sec.

ICA end diastolic velocity: 21 cm/sec.

ICA/CCA peak systolic ratio: 0.9

ICA plaque: Mild plaque burden. The plaque is echogenic with calcified shadowing elements.

RIGHT VERTEBRAL ARTERY WAVEFORM: Normal.

LEFT CAROTID SYSTEM:

ICA peak systolic velocity: 96 cm/sec.

ICA end diastolic velocity: 23 cm/sec.

ICA/CCA peak systolic ratio: 1.5

ICA plaque: Mild to moderate plaque burden. The plaque is echogenic with calcified shadowing elements.

LEFT VERTEBRAL ARTERY WAVEFORM: Normal.

Memorial Hospital

Name:	BERRY, VICKIE L	Admit Date:	9/9/2022
MRN:	10502	Discharge Date:	9/9/2022
Encounter:	6625454	Attending:	Du MD, Cheng

Ultrasound

Radiology Report

THYROID: Any visualized thyroid tissue is unremarkable.

ADDITIONAL COMMENTS: None.

IMPRESSION:

1. Mild plaque within the proximal right internal carotid artery. Doppler velocity measurements indicate no hemodynamically significant stenosis (less than 50% diameter stenosis). No change in carotid stenosis from prior study.
2. Mild to moderate plaque within the proximal left internal carotid artery. Doppler velocity measurements indicate no hemodynamically significant stenosis (less than 50% diameter stenosis). No change in carotid stenosis from prior study.
3. Antegrade vertebral artery flow.

Velocity criteria are extrapolated from diameter data as defined by the Society of Radiologists in Ultrasound Consensus Conference, Radiology 2003; 229;340-346.

-------------------------------	---------------------------------------	--	-----------------------------------	---------------------------------

Reason for Exam

(US Carotid Duplex Bilateral) dizzy

Radiology Report

EXAMINATION: US CAROTIDS, BILATERAL

Date: 9/26/2023 2:08 PM

History: Female, 70 years old. Dizzy. Hyperlipidemia and hypertension.

COMPARISON: 9/9/2022 carotid ultrasound

TECHNIQUE: Grayscale, color Doppler, and pulse wave Doppler analysis of both right and left carotid system(s).

FINDINGS:

Internal carotid stenosis estimations are based on velocities using Society of Radiologists in Ultrasound (SRU) criteria.

RIGHT CAROTID SYSTEM:

ICA peak systolic velocity: 70 cm/sec.

ICA end diastolic velocity: 30 cm/sec.

ICA/CCA peak systolic ratio: 1.2

ICA plaque: Mild plaque burden. The plaque is echogenic with calcified shadowing elements.

RIGHT VERTEBRAL ARTERY WAVEFORM: Normal.

LEFT CAROTID SYSTEM:

ICA peak systolic velocity: 126 cm/sec.

ICA end diastolic velocity: 43 cm/sec.

ICA/CCA peak systolic ratio: 1.9

ICA plaque: Mild to moderate plaque burden. The plaque is echogenic with calcified and non calcified hypoechoic shadowing elements.

LEFT VERTEBRAL ARTERY WAVEFORM: Normal.

Encounter Diagnosis

Essential hypertension (Discharge Diagnosis) - 3/24/21

Gastro-esophageal reflux disease without esophagitis (Discharge Diagnosis) - 3/24/21

Hypothyroidism, acquired, autoimmune (Discharge Diagnosis) - 3/24/21

Mixed hyperlipidemia (Discharge Diagnosis) - 3/24/21

History of CVA (cerebrovascular accident) without residual deficits (Discharge Diagnosis) - 3/24/21

Aneurysm, cerebral (Discharge Diagnosis) - 3/24/21

Keratoconus (Discharge Diagnosis) - 3/24/21

Discharge Disposition: Home or Self Care

Attending Physician: Akande, Olusina

Allergies, Adverse Reactions, Alerts

No Known Medication Allergies

Assessment and Plan

Extracted from:

Title: OV - multiple issues	Author: Akande, Olusina	Date: 3/24/21
------------------------------------	--------------------------------	----------------------

1. Essential hypertension I10

Chronic, controlled.

Complicated by nothing.

Meds: No change in management

Labs: Future labs sent.

Imaging: EKG not on file

Counseled on lifestyle changes such as low salt diet, activity, and excess alcohol.

2. Gastro-esophageal reflux disease without esophagitis K21.9

Chronic, partially controlled.

Meds: Continue H2 therapy

No suspected reflux complications (barret/stricture).

Lifestyle: wt loss, avoid meals 2-3 hrs before bed.

3. Hypothyroidism, acquired, autoimmune E06.3

Chronic, stable

Labs: TSH sent.

Meds: Continue current medication.

Counseled on healthy activity and diet.

4. Mixed hyperlipidemia E78.2

Chronic, stable.

Most likely due to genetic expression.

ASCVD: Pending labs

Meds: No changes in management

Imaging: None.

Discussed healthy lifestyle.

5. History of CVA (cerebrovascular accident) without residual deficits Z86.73

Chronic.

Meds: Continue antiplatelet and statin

Referral: None

Continue to work towards optimal BP and glycemic control.

6. Aneurysm, cerebral I67.1

Subacute, stable.

Patient claims to have had aneurysms seen on imaging.

Most recent MRI and MRA reports do not mention anything about aneurysms.

Request for further documentation sent.

7. Keratoconus H18.609

Chronic

Has follow-up with corneal specialist to develop prescription contacts.

Patient to follow-up in 6 months for Medicare wellness.

Future Appointments

Appointment Date: 10/04/2021 09:30:00 AM

Scheduled Provider: Akande MD, Olusina

Location: Family Healthcare

Appointment Type: Physical (LMH)

Appointment Date: 10/14/2021 08:45:00 AM

Scheduled Provider: Anthony MD, Alan J

Location: Surgical Services

Appointment Type: Established Patient (LMH)

Assessment and Plan

Extracted from:

Title: OV: Anxiety	Author: Akande MD, Olusina	Date: 4/22/25
---------------------------	-----------------------------------	----------------------

1. Depression with anxiety F41.8

Assessment: Patient reports ongoing anxiety symptoms despite medication management. The patient states she is "going nuts" and feels "miserable." She has decided to seek counseling to address the mental aspects of her condition. Current medication regimen appears to be partially effective in managing symptoms.

Plan:

- Maintain current anxiety medication regimen
- Refer patient to Integrity in Kokomo for counseling with a female therapist

2. Insomnia G47.00

Assessment: Patient denies current sleep issues. She reports taking 2 trazodone, which appears to be effective in managing her sleep disorder.

Plan:

- Continue current trazodone regimen
- Monitor for any changes in sleep patterns or medication effectiveness

3. Essential hypertension I10

Assessment: Patient's blood pressure was reported as "really good today," indicating well-controlled hypertension.

Plan:

- Continue current antihypertensive regimen
- Monitor blood pressure at future visits

Follow up:

- Patient to follow up in one year for routine evaluation and management of ongoing health issues.

Chief Complaint

6 month follow up

discuss increasing anxiety medication and referral for counceling

History of Present Illness

Patient consented to the use of Freed to record and transcribe notes during this visit.

Vickie Berry, a 72-year-old female, presents for a six-month follow-up, primarily concerned about worsening anxiety. She reports feeling "miserable" and states she's "going nuts" due to her anxiety symptoms.

The patient describes that while her current medication helps with some symptoms, she continues to struggle with the "mental stuff." In an effort to address these ongoing issues, she has decided to seek counseling. She expresses a preference for a female therapist and mentions hearing positive things about Integrity in Kokomo.

Ms. Berry reports that her blood pressure was "really good today," suggesting an improvement in her cardiovascular health. She also notes changes in her foot size, stating that she used to wear size eight-and-a-half shoes but now wears seven-and-a-half. She questions the cause of this change,

wondering if it's possible for feet to shrink or if shoe sizes are changing.

The patient acknowledges weight gain and expresses an intention to start walking for exercise. However, she reports getting out of breath easily, which concerns her children who advise her to slow down. This shortness of breath is impacting her ability to increase her physical activity.

Overall, Ms. Berry appears to be struggling with anxiety management despite medication, experiencing changes in her physical health including weight gain and shortness of breath, and is actively seeking additional mental health support through counseling.

Review of Systems

- General: Patient reports feeling miserable and anxious. She gets out of breath easily.
- HEENT: No recent visual problems, ear pain, nasal congestion, or sore throat.
- Respiratory: Patient reports getting out of breath easily.
- Cardiovascular: No chest pain, palpitations, or syncope.
- Gastrointestinal: No nausea, vomiting, or diarrhea.
- Genitourinary: No hematuria or burning with urination.
- Hema/Lymph: No reported increased bruising or swollen lymph nodes.
- Endocrine: No report of excessive thirst or hunger.
- Musculoskeletal: Patient reports her feet have shrunk in size.
- Skin: No rash, pruritus, or abrasions.
- Neurologic: Alert and oriented x 4.
- Psychiatric: Patient reports severe anxiety and feeling miserable. She has decided to go to counseling and is taking medication for anxiety symptoms.

Physical Exam

Vitals & Measurements

T: 35.6 °C (Temporal Artery) HR: 70 (Peripheral) RR: 16 BP: 102/83 SpO₂: 96%

HT: 162.56 cm WT: 82.3 kg BMI: 31.14 BSA: 1.93

- General: No acute distress.
- HEENT: Normocephalic, atraumatic, anicteric, and hearing is grossly intact.
- CV: No LE edema.
- Pulm: No signs of respiratory distress.
- GI: Non-distended with no apparent masses or pulsations.
- MSK: Extremities appear atraumatic w/o deformity, normal bulk and tone, no clubbing or cyanosis.
- Skin: Skin appears dry and intact without rashes or lesions.
- Neuro: A&O, normal speech, CN II - XII grossly intact, no gross motor abnormalities.
- Psych: Appropriate mood/affect, normal judgment/insight, no hallucinations, no SI/HI noted.

Depression Screening

Depression Screen

PHQ 2

PHQ 9

Little Interest - Pleasure in Activities: Nearly every day

Trouble Falling or Staying Asleep: Not at all

Feeling Down, Depressed, Hopeless: Several days

Feeling Tired or Little Energy: Nearly every day

Initial Depression Screen Score: 4 Score

Poor Appetite or Overeating: Nearly every day

Feeling Bad About Yourself: Not at all

Trouble Concentrating: Nearly every day

Moving or Speaking Slowly: Nearly every day

Thoughts Better Off Dead or Hurting Self: Not at all

Detailed Depression Screen Score: 12

Total Depression Screen Score: 16

Assessment/Plan

1. Depression with anxiety F41.8

Assessment: Patient reports ongoing anxiety symptoms despite medication management. The patient states she is "going nuts" and feels "miserable." She has decided to seek counseling to address the mental aspects of her condition. Current medication regimen appears to be partially effective in managing symptoms.

Plan:

- Maintain current anxiety medication regimen
- Refer patient to Integrity in Kokomo for counseling with a female therapist

2. Insomnia G47.00

Assessment: Patient denies current sleep issues. She reports taking 2 trazodone, which appears to be effective in managing her sleep disorder.

Plan:

- Continue current trazodone regimen
- Monitor for any changes in sleep patterns or medication effectiveness

3. Essential hypertension I10

Assessment: Patient's blood pressure was reported as "really good today," indicating well-controlled hypertension.

Plan:

- Continue current antihypertensive regimen
- Monitor blood pressure at future visits

Follow up:

- Patient to follow up in one year for routine evaluation and management of ongoing health issues.

Referral Orders

BERRY, VICKIE L

DOB:03/01/1953

Age:70 years

Sex:Female

MRN:10502

Visit Date:10/09/2023

Primary Care Physician:

Akande MD, Olusina

Chief Complaint

Pt is here for follow up of carotid stenosis. Pt is here today to discuss carotid ultrasound results. Pt also needs surgery clearance for cataract correction.

History of Present Illness

on plavix

left carotid stenosis is worse

Right side No change in carotid stenosis from prior study.

left side 50-69% diameter stenosis. Increase in carotid stenosis from prior study.

She has Asymptomatic stenosis of intracranial artery I66.9

Vascular disease involving the cavernous portions of the ICAs without evidence of a greater than 50% stenosis.

She has History of CVA 6 years ago

Physical Exam

Vitals & Measurements

HT: 162.56 cm WT: 81.65 kg BMI: 30.9 BSA: 1.92

Well Developed. Mood ok

Observation: calm

MS: Awake +O x3 , fund knowledge ok

Good attention and concentration

Short and long term memory ok

Fluent good naming & vocab, repetition and comprehension normal

CN: Fields + EOMs full, face sense/power NI, hears well,

palate/tongue midline, SCM NI

Sense: NI PP

Motor: NI power up and low, no prominent muscle atrophy, no abnormal movements.

FNF N & stances N on sit

pre 10 mnin

face and post 32 min

Assessment/Plan

1. Carotid stenosis I65.29

2. History of CVA in adulthood Z86.73

letter given and need to be cleared by vascular surgery before eye surgery

refer to cardiovascular surgery

Referral Orders

Referral Management, Medical Service: RM Cardiovascular & Thoracic Surgery, Reason: left carotid 50-69% stenosis and worse, Start: 10/09/23 8:31:00 EDT, Carotid stenosis | History of CVA in adulthood

Problem List/Past Medical History

Ongoing

Reason for Exam

(XR Ankle Complete 3+ Views Right) pain after trauma

Radiology Report

EXAMINATION: XR ANKLE, MIN 3 VIEWS, RT and XR FOOT COMPLETE, MIN 3 VIEWS, RT

Date: 4/11/2022 6:09 PM

History: Female, 69 years old. Pain after trauma. Tech Notes: --Pain after fall at the park. Swelling and bruising to top lateral side of foot and lateral side of ankle. No surgery

COMPARISON: None.

Technique: Right ankle 3 views; foot 3 views.

ANKLE FINDINGS:

Bones: Nondisplaced transverse, intra-articular, right lateral malleolus fracture

Joint: Normal alignment.

Soft tissues: Moderate soft tissue swelling over the right malleolus.

FOOT FINDINGS:

Bones: Comminuted intra-articular right proximal right 5th metatarsal fracture.

Joint: No malalignment.

Soft tissues: Moderate soft tissue edema in the lateral aspect of the right foot.

IMPRESSION:

Ankle:

1. Nondisplaced transverse, intra-articular, right lateral malleolus fracture
2. Moderate soft tissue swelling over the right malleolus.

Foot:

1. Comminuted intra-articular right proximal right 5th metatarsal fracture.
2. Moderate soft tissue edema in the lateral aspect of the right foot.

MULTIPLE STUDIES are included in this report.

Reason for Exam

(XR Ankle Complete 3+ Views Right) right ankle fracture post op

Radiology Report

EXAMINATION: XR ANKLE, MIN 3 VIEWS, RT

Date: 5/4/2022 10:18 AM

History: Female, 69 years old. right ankle fracture post op Tech Notes: -- 2 week post op check up

COMPARISON: April 11, 2022.

Technique: Right ankle 3 views.

FINDINGS:

A cast is in place, which somewhat limits evaluation. Metallic plate and screws of the right distal fibula. Hardware appears intact. There is also a lag screw of the 5th metatarsal proximally. Ankle mortise grossly intact. No acute fracture identified. There is soft tissue swelling.

IMPRESSION: Surgical hardware appears grossly intact.

Reason for Exam

(XR Ankle Complete 3+ Views Right) **AFTERCARE FOLLOWING SURGERY**

Radiology Report

EXAMINATION: XR ANKLE, MIN 3 VIEWS, RT

Date: 6/1/2022 10:34 AM

History: Female, 69 years old. **AFTERCARE FOLLOWING SURGERY** Tech Notes: -- Pt states routine 6 week f/u right ankle ORIF.

COMPARISON: 11 April 2022, 4 May 2022.

Technique: Right ankle 3 views.

FINDINGS:

Bones: A metallic plate and multiple screws transfix a fracture of the distal fibula. Margins of the fracture are becoming indistinct indicating that healing is occurring. A single screw also transfixes a fracture of the proximal 5th metatarsal. The margin of this fracture also is becoming indistinct indicating that healing is occurring. Minimal plantar and Achilles spurring of the attachments to the calcaneus is noted. Calcification in the Achilles tendon also is noted.

Joint: Normal alignment.

Soft tissues: Unremarkable.

IMPRESSION:

1. Satisfactory internal fixation, alignment, and progression towards healing of fractures of the distal fibula and the proximal 5th metatarsal.
2. Calcaneal spurring.
3. Calcification of the Achilles tendon.

Radiology Report

EXAMINATION: XR ANKLE, MIN 3 VIEWS, RT

Date: 6/22/2022 10:40 AM

History: Female, 69 years old. aftercare following surgery Tech Notes: -- Pt states routine 9 week post right ankle ORIF.

COMPARISON:

Right ankle radiographs 6/1/2022

Technique: Right ankle 3 views.

FINDINGS:**Bones/joints:**

Metallic fixation hardware in the distal fibula, consistent with prior fracture open reduction internal fixation. No fracture line currently visible. Alignment is anatomic.

Metallic screw in the proximal aspect of the 5th metatarsal, consistent with prior fracture open reduction internal fixation. No fracture line currently visible. Alignment is anatomic.

Soft tissues:

Unremarkable.

IMPRESSION:

1. No fracture line visible. Reduction maintained regarding fractures of the distal fibula and proximal 5th metatarsal.
